Appendix

This appendix includes the intersection geometries, existing intersection traffic counts, future turning movement forecasts, and level of service (LOS) summaries.

Introduction

This study describes the transportation impacts associated with the development under the proposed planned action designation in the Federal Way City Center (FWCC) project located in Federal Way, WA. This study assesses the expected impact of the proposed land use changes in the City Center planning area on the City's transportation systems, including roadway intersections, transit, bicycles, and pedestrian facilities, and identifies actions and improvements to mitigate the impacts. The study follows the City of Federal Way Public Works Department *Guidelines for the Preparation of Transportation Impact Analyses* (September 9, 2014). Individual development projects proposed within the Federal Way City Center planning area may be required to provide additional analysis of the specific impact of their project on the transportation system as directed by the Director of Public Works.

Project Description

The proposed Federal Way City Center will develop an urbanized central core within Federal Way containing a mix of land uses including housing, retail, and civic uses. The City's Comprehensive Plan describes the principal purposes of the Federal Way City Center as to:

- Create an identifiable downtown that is the social and economic focus of the City;
- Strengthen the City as a whole by providing for long-term growth in employment and housing;
- Promote housing opportunities close to employment;
- Support development of an extensive regional transportation system;
- Reduce dependency on automobiles;
- Consume less land with urban development;
- Maximize the benefit of public investment in infrastructure and services;
- Reduce costs of and time required for permitting;
- Provide a central gathering place for the community; and
- Improve the quality of urban design for all developments.

This vision will be carried out by encouraging a compact form of development that will mix retail, commercial, and residential land uses. The FWCC transit center and the FWCC Park & Ride will be a key component of the planning area, supported by a high level of non-motorized facilities, amenities, and transit services that will reduce dependency on the automobile and provide transportation choices.

This report summarizes the analysis of the following alternatives:

- **2015 Existing Conditions.**
- **2025 No Action Alternative** includes an increase in land use in the City Center area. It assumes the funded Transportation Improvement Projects would be completed in the study area.
- **2025 Action Alternative** includes an increase in land use over the No Action Alternative for Federal Way's City Center and the same funded Transportation Improvement Project projects.

The primary difference between the future No Action and Action alternatives is the land use mix. The Action Alternative provides an increase in the amount of office space, residential, and hotel space. Table 1 displays the land use mix by alternative.

Table 1. Land Use Mix by Alternative

	Retail (sq. ft.)	Office (sq. ft.)	Residential (units)	Hotel (rooms)
Existing	1,833,189	67,045	254	230
No Action	2,505,379	329,427	1,925	230
Action	2,308,190	467,045	2,654	830

Affected Environment

This section summarizes the selection of the study area, existing roadway network, the project area and existing land use. This section also summarizes the findings of the traffic operations of existing intersections and collisions analysis. The existing transit, pedestrian, and bicycle facilities are also described.

Study Area

This section summarizes the approach for analyzing 2015 Existing Conditions for intersections and corridors in the study area; the City of Federal Way's *Guidelines for the Preparation of Transportation Impact Analyses* (September 9, 2014), was used to guide the analysis approach and provides greater detail.

The study area, which is larger than the Planned Action Area, was developed by using the city's travel demand model to calculate the anticipated vehicle volume increase at intersections. Study intersections were identified for analysis if they met the following conditions:

- PM peak hour: Intersection is signalized and outside the City Center with an increase of 30 or more vehicle trips and a volume-to-capacity (v/c) ratio over 0.7. All intersections surrounding the City Center area were included in the study area provided they met the City's threshold
- AM and Saturday mid-day peak hours: Intersection is anticipated to experience an increase of 100 or more vehicle trips. All intersections surrounding the City Center that were included in the PM analysis were included in AM and Saturday analysis.

The study area intersections are presented in Table 2. Figure 1 presents the PM distribution along with the study intersections. A percentage of total trips generated from the City Center area was used to determine the intersections potentially impacted by the development. More intersections were analyzed during the PM peak hour because vehicle volumes were greater compared to the AM and Saturday Midday peak hours. Also, this provided a more conservative analysis of the overall study area.

* Intersection is located outside of City of Federal Way limits

** Unsignalized Intersection

Existing Roadway Network

The existing street network around the City Center is mostly grid-like with four legged intersections. Interstate-5 (I-5), Pacific Highway / State Route 99 (SR 99), and State Route 161 (SR 161) are in the study area and provide regional access to the north and south. Access ramps to I-5 are provided at 272nd Street, 320th Street, and 348th Street.

I-5 is a limited access facility that provides four general purpose lanes and a high occupancy vehicle lane in each direction. The posted speed limit is 60 miles per hour. Pacific Highway South (SR 99) is a Principal Arterial with five to seven travel lanes, including HOV lanes and turning lanes at intersections. The posted speed limit on SR 99 is 40 mph south of S 304th Street and 45 mph north of S 304th Street. SR99 provides access to Seattle and SeaTac International Airport to the north and

the city of Tacoma to the south. SR 161 provides access to the City of Puyallup. It is a five lane arterial with a posted speed limit ranging from 40 mph to 45 mph.

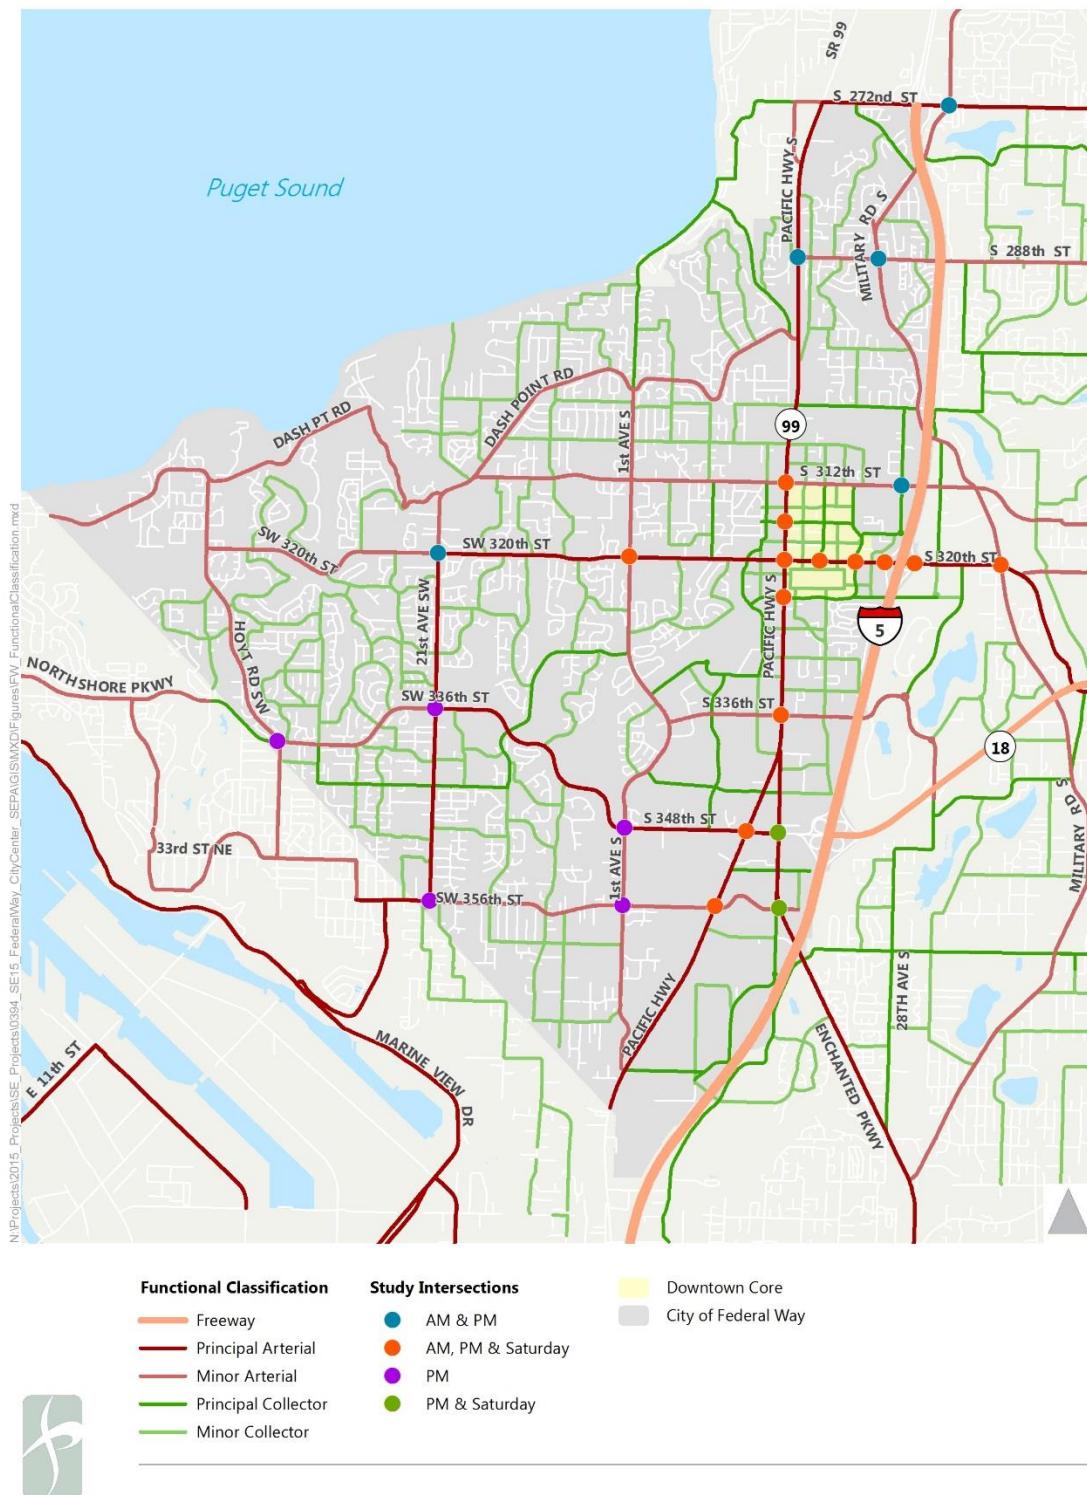

S 272nd Street is a Principal Arterial that runs east-west and provides the City Limits to the north. S 272nd Street provides access to SR 99 at a signalized intersection, as well as ramps to access I-5 northbound and southbound. The roadway has four travel lanes with additional turn lanes.

S 320th Street is a Principal Arterial that runs east-west. The roadway has seven travel lanes in the City Center and five travel lanes outside of the City Center with additional turning lanes at intersections. The roadway provides access to SR 99 at a signalized intersection and access ramps to I-5 northbound and southbound. S 320th Street between SR 99 and I-5 carries over 35,000 vehicles per day.

S 348th Street is a Principal Arterial that runs east-west; it becomes SW Campus Drive west of 1st Avenue S and SR 18 east of Pacific Highway S. S 348th Street has five travel lanes. SR 18 is a state owned divided highway with two to four lanes in each direction. The roadway provides regional access continuing east through Auburn and northeast to I-90 in Snoqualmie.

The functional classification of Federal Way's roadway network is shown in Figure 2.

Figure 2. Functional Classification

Project Area and Existing Land Use

The City Center project area is bounded by S 324th Street to the south, 23rd Avenue South to the east, S 312th Street to the north, and SR 99 to the west. Figure 3 shows the Federal Way City Center project area. The City Center area is a mix of retail, office, senior housing, multi-family households, and hotels. This area provides the greatest concentration of shopping and businesses in the city of Federal Way. There are also businesses located on the west side of SR 99 and the area outside of the City Center is mostly residential. The square footage of the City Center is summarized in Table 3.

Table 3. Existing Land Use

	Retail (sq. ft.)	Office (sq. ft.)	Residential (units)	Hotel (rooms)
2015 Existing Conditions	1,833,189	67,045	254	230

Figure 3. Project Location

Project Location

 City Center

Corridor Right-of-Way

The Federal Way Revised Code Section 1.05.020 defines right-of-way as, “land owned, dedicated or conveyed to the public or a unit of government, used primarily for the movement of vehicles or pedestrians and providing for access to adjacent parcels, with the secondary purpose of providing space for utility lines and appurtenances and other devices and facilities benefiting the public. “Right-of-way” includes, but is not limited to, any street, easement, sidewalk, or portion thereof under the jurisdiction of the city.”

The City of Federal Way’s Comprehensive Plan provides a network of “City Center” roadways that meet the higher level of amenities for the Federal Way City Center planning area (Figure 3). The need for wider sidewalks, bicycle lanes, street lighting, and street trees resulted in the City designating specific standards for Federal Way City Center roadways. Table 4 summarizes the required and the typical amounts of right-of-way found on major roadways within the Federal Way City Center planning area.

Table 4. Right-of-Way for Major Area Streets

Roadway	Required City Center right-of-way	Existing right-of-way
Pacific Highway S (SR 99)	120 feet	100-140 feet
S 324 th Street	96 feet	66 feet
S 320 th Street	100 feet	100-140 feet
S 316 th Street	74 feet	60 feet
S 312 th Street	85 feet	60-85 feet
20 th Avenue S	60 feet	60 feet
23 rd Avenue S	85 feet	80-82 feet

Source: King County Assessor 2003

As summarized in Table 4, Pacific Highway S, S 324th Street, S 316th Street, S 312th Street and 23rd Avenue S all have inadequate right-of-way. In addition, the City Center plan calls for a number of internal roadways to create smaller blocks that will improve the grid network and improve the access for pedestrians and vehicles. These internal grid roads require 70 feet of right-of-way with two vehicle lanes, 12 feet of sidewalks, and on-street parking. Right-of-way dedication and street improvements shall be a component of the development submittal phase of a proposed project within the Federal Way City Center. Additional information on ultimate roadway cross-sections can be found in Map III-4 of the Transportation Element of the City’s Comprehensive Plan.

Existing Traffic Operations

Traffic counts were collected in Fall 2014 or July 8, 2015 between 4:00 pm and 6:00 pm and Wednesday July 8, 2015 between 6:00 am and 8:00 am. Saturday traffic counts were collected July 11, 2015 between 11:00 am and 1:00 pm. The analysis of intersections was completed for the highest hour of vehicle traffic for the AM, PM, and Saturday midday peak hours.

In 2015, the city of Federal Way revised their level of service (LOS) standard for intersections. This standard is used to determine whether an intersection is operating at an acceptable condition. The standard provides a volume-to-capacity (v/c) ratio compared to the previous intersection average vehicle delay (also known as level of service or LOS). The current standard states that signalized intersections should have a volume-to-capacity (v/c) ratio less than 1.2 outside of the City Center or

less than 1.0 at any unsignalized intersection. Signalized intersections inside of the City Center should experience an average volume-to-capacity (v/c) ratio of 1.1 or less. An intersection with a volume-to-capacity ratio greater than the standard is considered deficient and would require mitigation to bring the intersection into acceptable conditions.

The traffic analysis software Synchro 8 was used to calculate the volume-to-capacity ratios by reporting results using the Highway Capacity Manual 2000 outputs. The volume-to-capacity ratio is determined for intersections using Highway Capacity Manual 2000 methodology because it provides an overall volume-to-capacity (v/c) ratio for signalized intersections. The unsignalized intersection of S 312 Street and 28th Avenue S was analyzed using Highway Capacity Manual 2010 methodology, and the approach movement with the highest volume-to-capacity (v/c) ratio is reported.

Table 5 and Figure 4 through Figure 6 summarize the results of the intersection operations analysis including intersection level of service (LOS), average intersection vehicle delay, and volume-to-capacity (v/c) ratio. None of the intersections were found to be deficient.

The intersection geometries, existing intersection traffic counts, future turning movement forecasts, and level of service (LOS) summaries are found in the Appendix to this report.

Parking

The existing number of parking stalls in the Federal Way City Center area reflects the more auto-orientated development pattern of current land uses. Table 6 summarizes the number of parking spaces required by City Code for each existing land use.

Table 6. Existing Parking Requirements

	Retail (sq. ft.)	Office (sq. ft.)	Residential (units)	Hotel (rooms)	Total Spaces Per Code
City Code	1 per 300 sq. ft.	1 per 300 sq. ft.	1.7 per unit	1 per room	
Existing Square Footage	1,833,189	67,045	254	230	
Existing Parking Requirement per Code	6,111	223	432	230	6.996

Data provided by the City estimates that there are approximately 8,960 parking stalls provided in the Federal Way City Center area. As summarized in Table 6, nearly 2,000 additional parking stalls are provided above what existing code requires.

Collision Analysis

Review of historical collision data provides an indication of the location and severity of incidents at intersections and along corridors. Historical analysis is useful in understanding the typical types of collisions that occur at a particular location; however, the data may not be indicative of future collision rates or causes. A number of factors can contribute to collisions including:

- Traffic congestion (ability to maneuver)
- Driver skills (driver age and experience)
- Driver behavior (speeding, aggressiveness, driving while intoxicated)
- Roadway geometrics (sight distance)
- Weather conditions (rain, glare, snow)
- Nature (animals, fallen trees)
- Vehicle condition, equipment and maintenance (brakes, tires)
- Roadway condition (pavement condition)

Five years of collision data, 2010 through 2014, were analyzed to identify collision trends in the study area. The City requires the identification of high collision intersections and roadway corridors defined as follows:

- A collision rate of more than 1.0 collision per million entering vehicles (MEV) at an intersection.
- A collision rate of more than 10.0 collisions per million vehicle miles (MVM) on a roadway segment. Roadway segments are defined as arterials and principal collectors between and including intersections of collectors and arterials.

Table 7 provides the calculated collision rates for the study intersections and roadway segments. Results indicate that three of the 23 intersections and one of the 15 roadway segments could be considered to have high collision rates. The City has either improved or planned to improve these locations to address high collision rates.

Table 7. Five-year Collision Rates (2010 – 2014)

Intersection ¹	Total Collisions	Collision Rate (MEV) ²
S 288 Street & Military Road S	60	0.99
S 288 Street & Pacific Highway S	47	0.55
S 312 Street & 28 Avenue S	10	0.45
S 320 Street & 1 Avenue S	65	0.89
S 320 Street & I-5 NB Ramp	7	0.09
S 320 Street & I-5 SB Ramp	25	0.29

S 356th Street from 1st Avenue S to 16th Avenue S/Enchanted Pkwy	102	4.29

Note: Bold values indicate high collision locations, as defined by City standards.

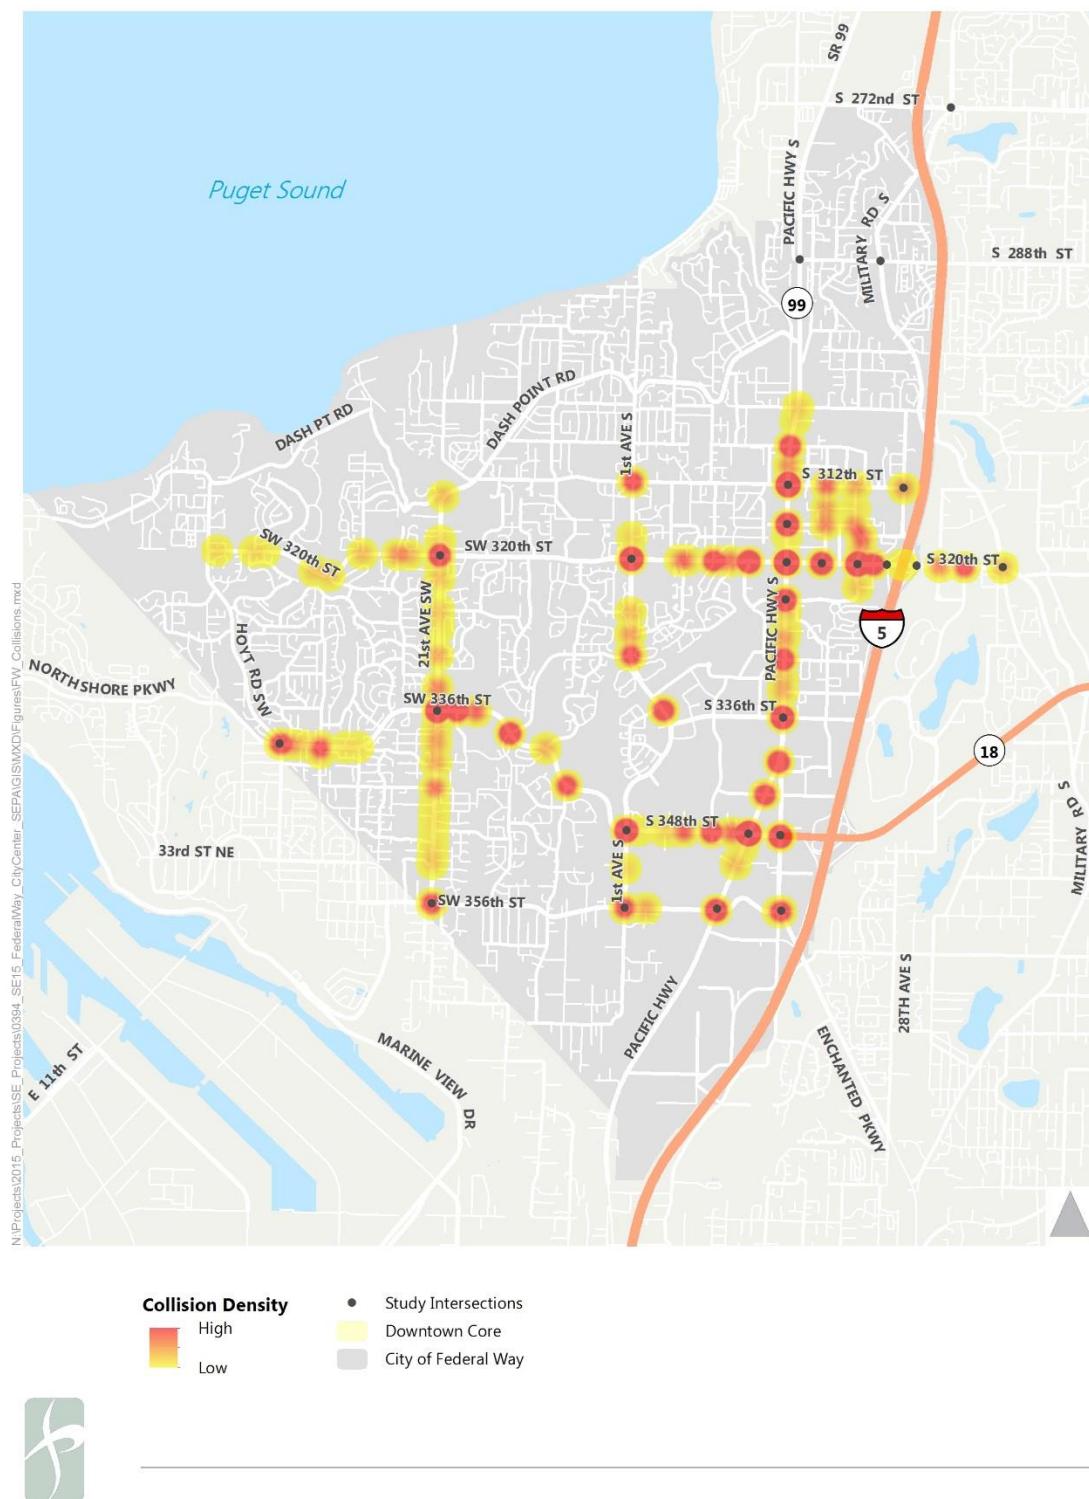

¹ The City does not maintain data for the study intersections at S 272 Street & Military Road S and S 320 Street & Military Road S

² MEV = million entering vehicles; MVM = million vehicle miles

Source: City of Federal Way Collision Database

The City of Federal Way, in general, attributes the majority of collisions to congestion at roadways and intersections. The congestion related delay at intersections can result in driver risk-taking by attempting to reduce wait times. Improving mobility and access to all modes, reducing conflict points, and reducing travel delay may reduce some types of collision along the corridor. The City traffic engineering department monitors collision data and corrects roadway and intersection issues that could contribute to higher collision rates at specific locations. Figure 7 provides a collision density ‘heat map’ for the analyzed intersections and roadway segments.

Figure 7. Collision Density Heat Map

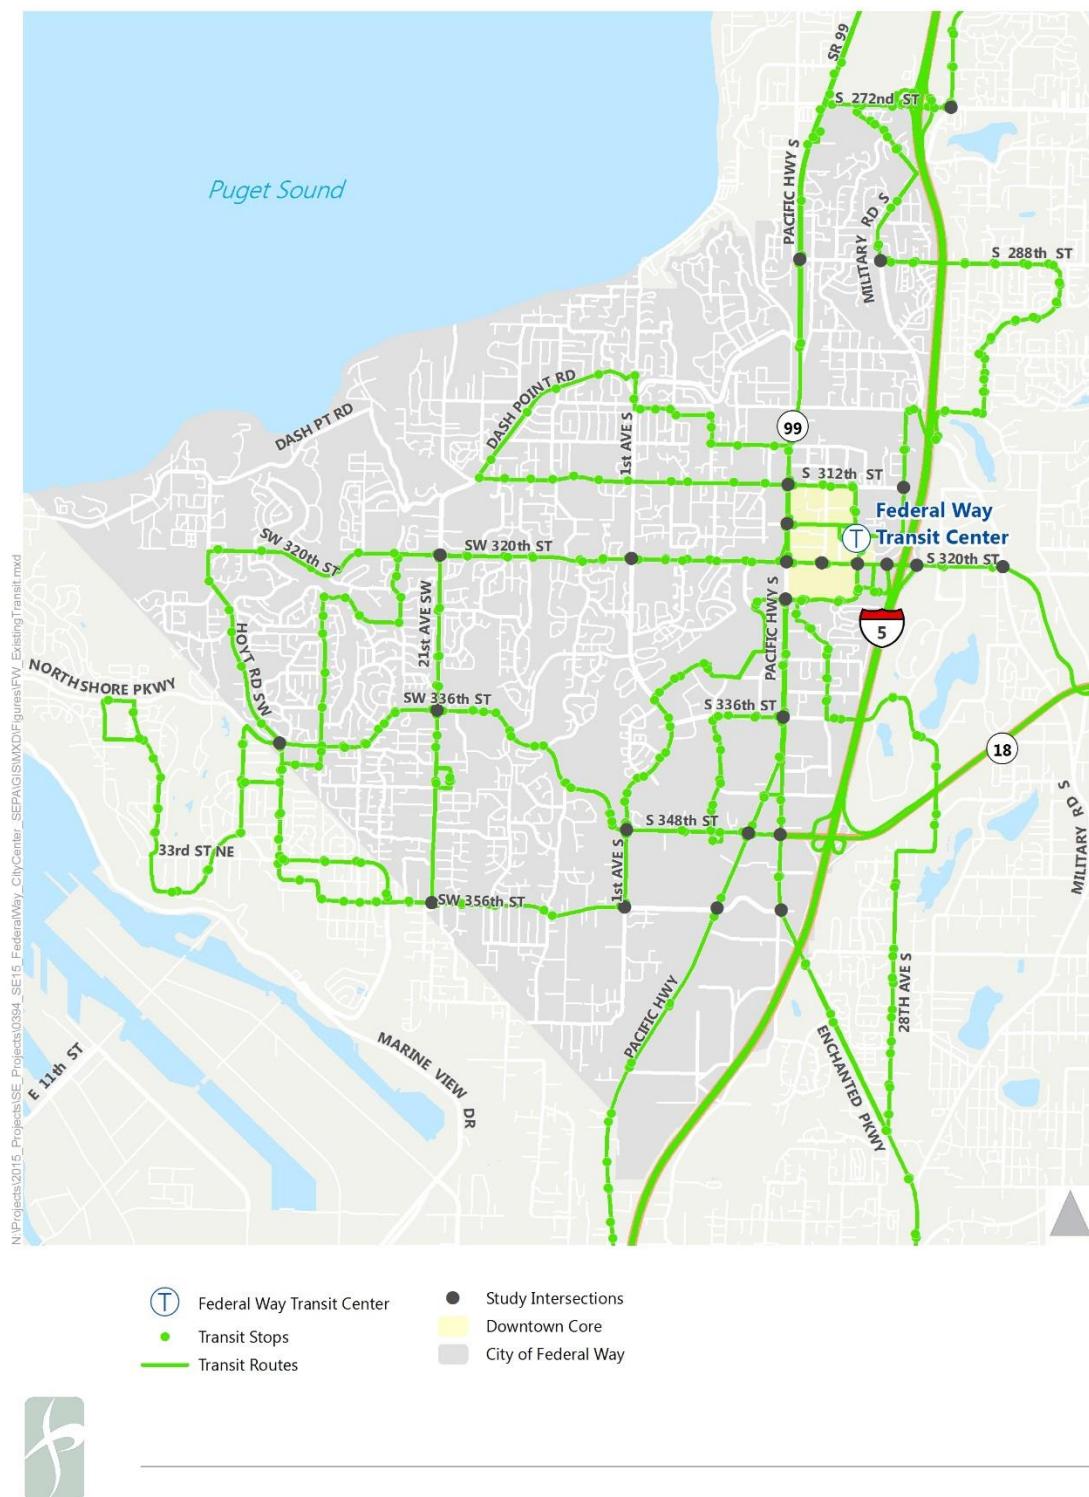

Transit Services

Federal Way Transit Center is located within the City Center on S 317th Street between 21st Avenue S and 23rd Avenue S. Within the study area, S 324th Street, S 320th Street, and S 312th Street are used to access the Transit Center. The Transit Center is served by Sound Transit routes 574, 577, and 578, King County Metro routes Rapid Ride A, 179, 181, 182, 183, 187, 193, and 197, and Pierce Transit routes 402, 500, and 501. Bicycle lockers and 1,190 vehicle parking spaces are provided at the Transit Center. The parking lot is heavily used during the weekday. The Transit Center provides direct access to high-occupancy vehicle (HOV) lanes on I-5.

Several bus routes stop in Federal Way with 3,000 to 3,500 person trips made by public transit service each day. About three percent of peak hour trips within Federal Way are transit trips. Figure 8 summarizes transit facilities in the study area, including King County Metro, Sound Transit, and Pierce Transit service.

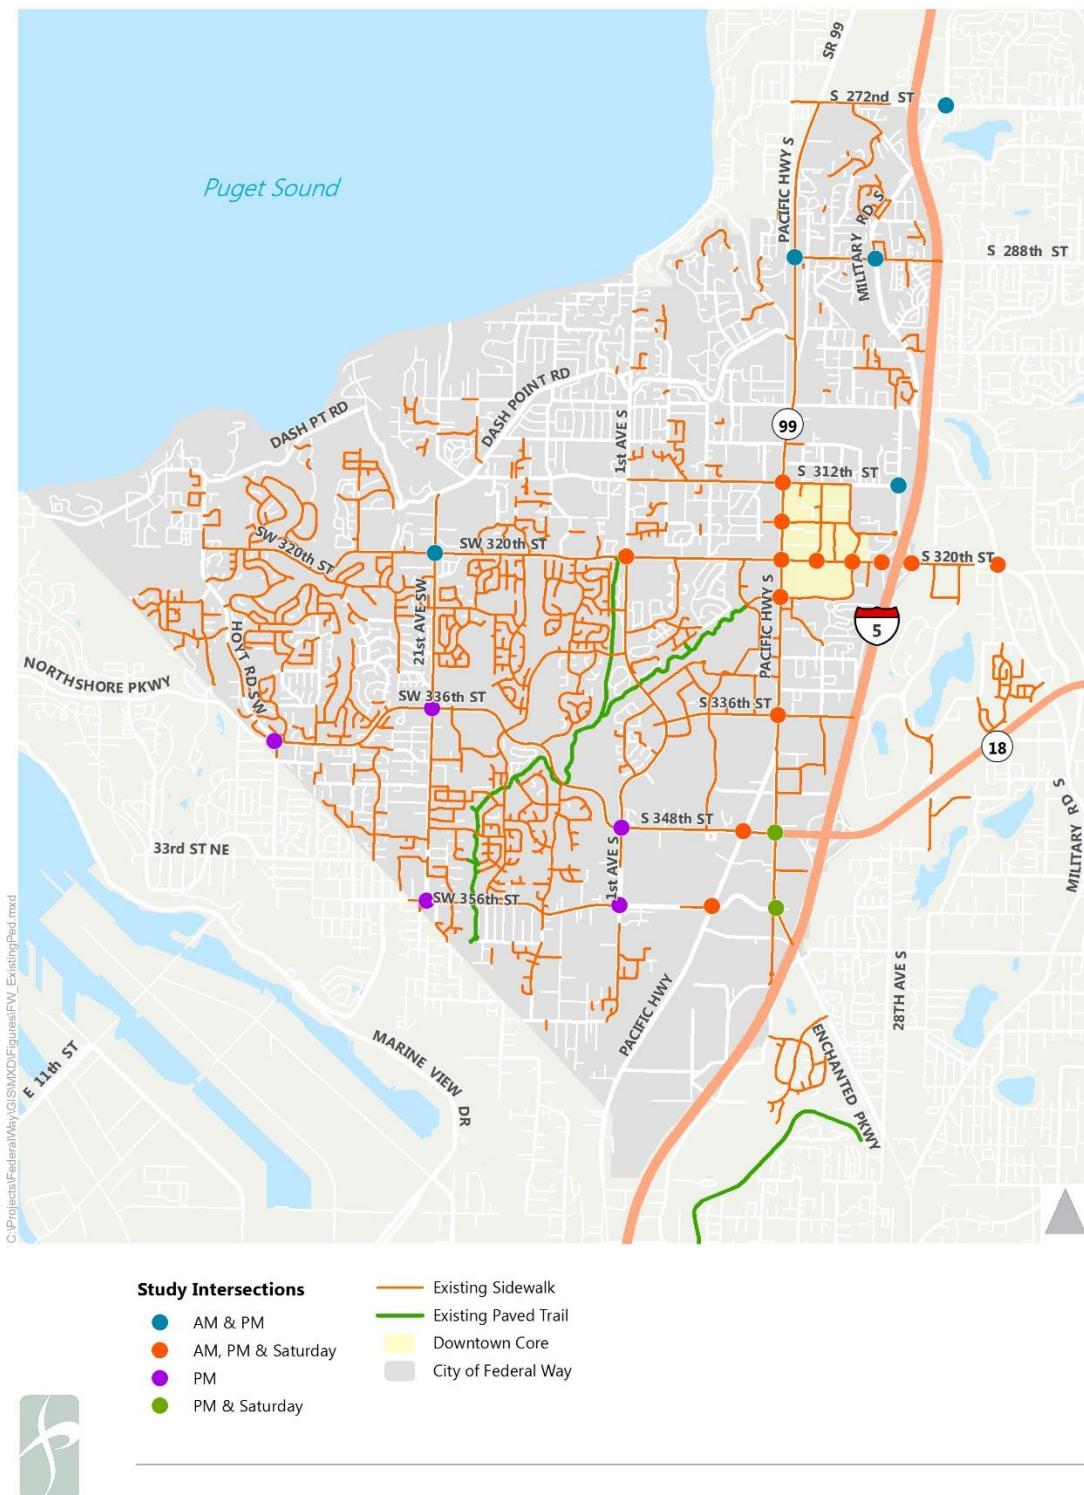

Figure 8. Transit Facilities

Pedestrian Facilities

The City of Federal Way has pedestrian connectivity with sidewalks on many streets in the study area. The Bonneville Power Administration (BPA) Trail is a paved pedestrian trail that connects residential areas to parks. Although there are sidewalks connecting the residential area with the City Center, walking is not a popular mode choice to shopping because of the high volume and high speed of vehicles on the roadway network and the relatively long distance between destinations. Figure 9 summarizes existing pedestrian facilities in the City of Federal Way.

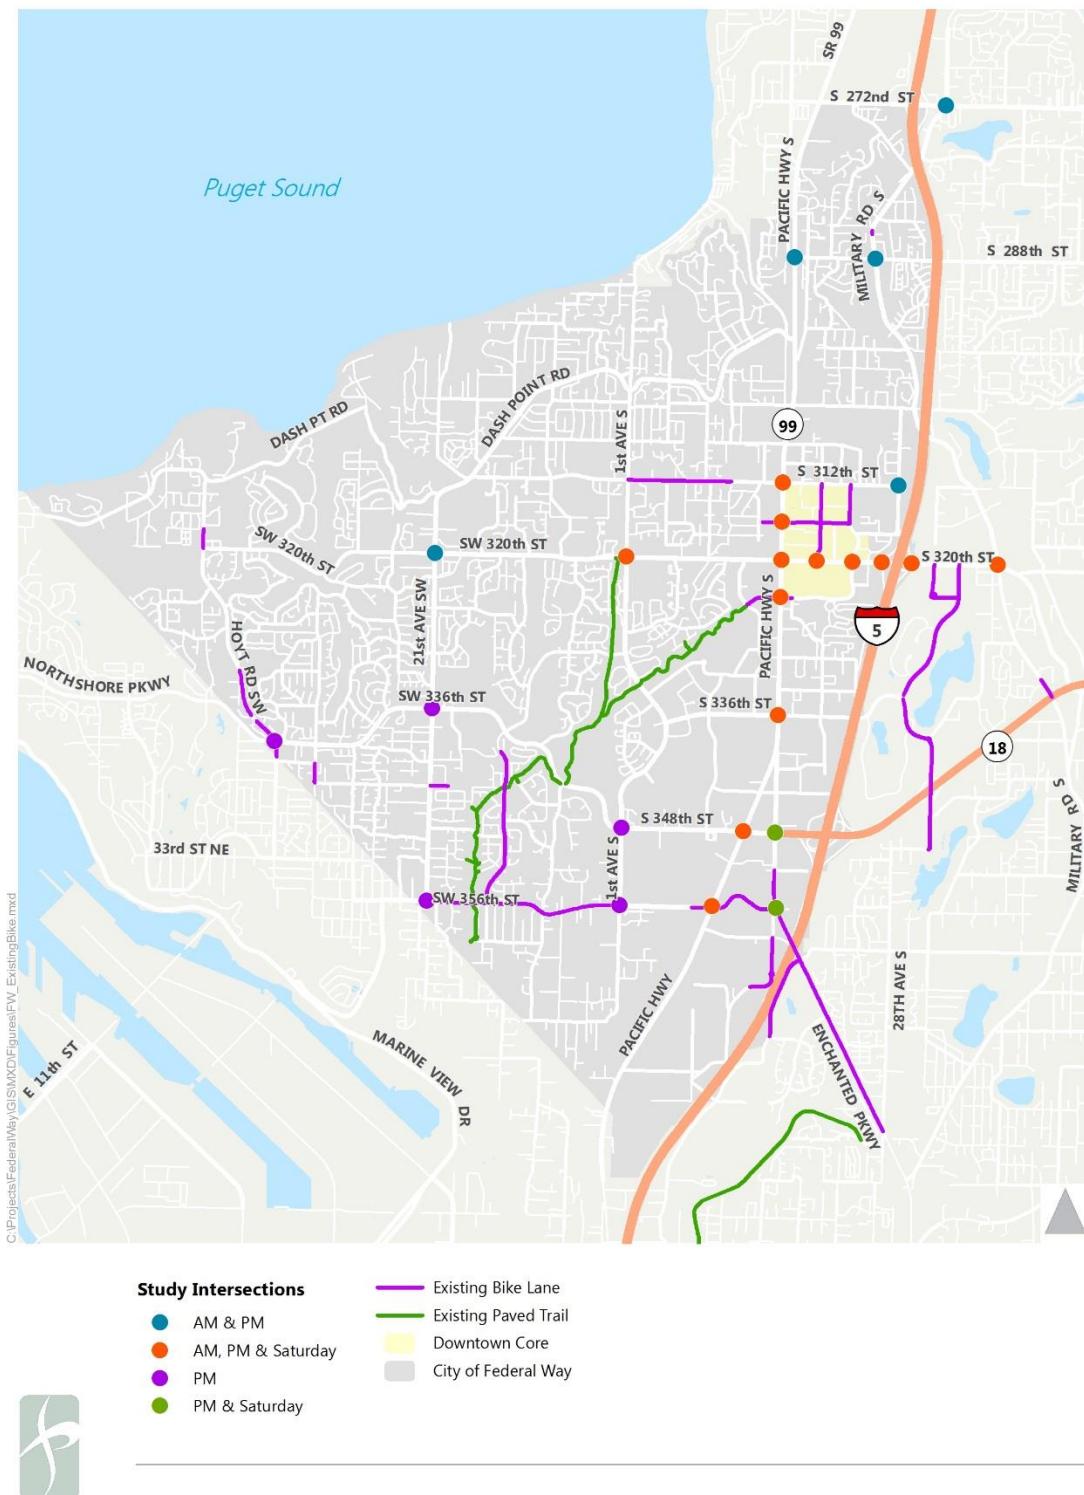

Figure 9. Pedestrian Facilities

Bicycle Facilities

The city's bicycle network consists of a range of facilities including bike lanes, wide shoulders, and the BPA Trail. The BPA Trail provides a connection for cyclists to the City Center. However, cyclists must cross SR 99, which may be a deterrent. Within the City of Federal Way, cyclists can bike on the sidewalk, except in the City Center where it is prohibited by ordinance. When surveyed as part of the Comprehensive Plan, residents cited a lack of bicycle infrastructure as the main cycling deterrent. Figure 10 summarizes existing bicycle facilities in the City.

Figure 10. Bicycle Facilities

Future Conditions

This section summarizes the transportation effects within the study area and at the City Center. It includes a summary of the land use assumed for the alternatives and roadway improvement assumptions.

Future Year Land Use

The Action Alternative proposes a mixed use development, which would provide the variety of land uses to create an urban center within Federal Way. The difference between the No Action and Action Alternatives is the land use assumptions in the City Center; the Action Alternative assumes an increase over the No Action alternative. Table 8 summarizes the land use quantities for the alternatives. The land use in the rest of the City and the greater Puget Sound Region is the same for both alternatives.

Table 8. City Center Land Use Future No Action and Action Alternatives

	Retail (sq. ft.)	Office (sq. ft.)	Residential (units)	Hotel (rooms)
Existing	1,833,189	67,045	254	230
No Action	2,505,379	329,427	1,925	230
Action	2,308,189	467,045	2,654	830

Roadway Improvements Assumptions

The city's *Transportation Improvement Plan (TIP)* highlights funded projects through the year 2040. Ten of the study intersections are expected to have funded planned projects between 2015 and 2025. Table 9 and Figure 11 summarize the projects assumed to be constructed by 2025 for both alternatives. Table 11 summarizes the specific improvements planned for study intersections.

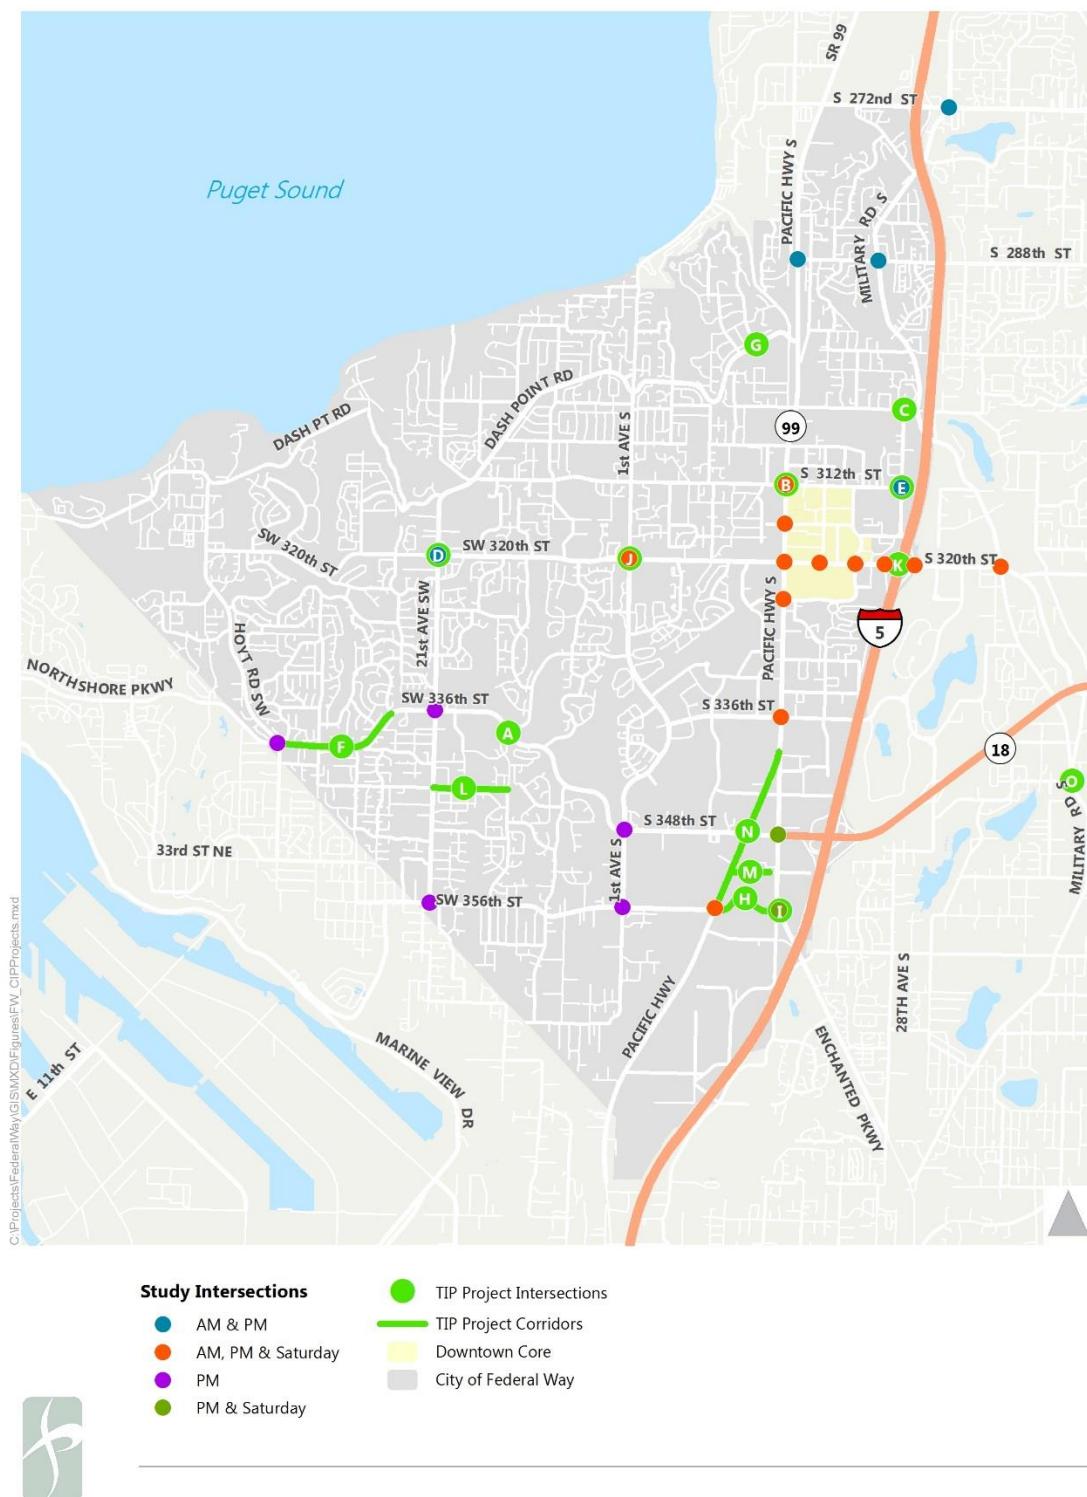

Table 9. Transportation Improvement Projects through 2025

Project	Location	Description
A	10th Avenue SW @ SW Campus Drive	Add SB right-turn lane
B	SR 99 @ S 312th Street	Add 2nd left-turn lane NB
C	S 304th Street @ 28th Avenue S	Add NB right-turn lane, signal
D	SW 320th Street @ 21st Avenue SW	Add 2nd WB left-turn lane, Interconnect to 26th Ave SW
E	S 312th Street @ 28th Avenue S	Add SB right-turn lane
F	SW 336th Way/SW 340th Street (26th PI SW to Hoyt Road SW)	Widen to 5 lanes, add signal at 26th PI SW
G	SE 509 @ 11th Place S	Add EB left-turn lane
H	S 356th Street (SR 99 to SR 161)	Widen to 5 lanes
I	S 356th Street @ SR 161	Add 2nd NB left to SR 161
J	S 320th Street @ 1 Avenue South	Add EBL, WBL, WBR, NBT, SBR; widen to 5 lanes N to 316 or Alternative Measure
K	S 320th Street @ I-5 Bridge Widening	Add HOV lanes, realign ramps in SE quadrant
L	SW 344th Street (12th Avenue SW to 21st Avenue SW)	Extend 3 lane principal collector
M	S 352nd Street (SR 99 to SR 161)	Extend 3 lane principal collector
N	SR 99: S 340 th Street to S 356 th Street	Construct Arterial HOV lanes, both directions
O	Military Rd @ S 342nd Street	Add northbound left-turn lane at the intersection and a two way left turn lane between S. 340th Street and S. 342nd Street.
P	SR 99 @ S 348 th Street	Add 2nd southbound left turn lane

Table 10. Changes to Study Intersection from TIP

Intersection	Improvement Description
SR 99 @ S 312th Street	Add 2nd left-turn lane NB
SW 320th Street @ 21st Avenue SW	Add 2nd WB left-turn lane
S 312th Street @ 28th Avenue S	Add SB right-turn lane
SW 340th Street @ Hoyt Road SW	Add WB lane, separate through and left lane.
S 356th Street @ SR 161	Add 2nd NB left to SR 161
S 320th Street @ 1 Avenue South	Restrict left turns on all approaches
S 320th Street @ I-5 SB	Add through lane on S 320 th Street both directions
S 320th Street @ I-5 NB	Add through lane on S 320 th Street both directions
SR 99 @ S 356 th Street	Add northbound through lane
SR 99 @ S 348 th Street	Add 2nd southbound left turn lane

Figure 11. Transportation Improvement Project Map

Trip Generation

Trip generation rates for the alternatives were developed using a travel demand forecasting model and Fehr & Peers MainStreet tool. A travel demand forecasting model is a computer model developed to project traffic volumes and patterns based upon land use and the characteristics of the transportation system. The roadway network under study, as well as the land use that generates traffic on that network, is coded into the model. The model projects traffic on the roadway system based on observed traffic data and statistical data that associates typical travelers' tendencies with land use. A model of existing conditions is first created, and calibrated according to observed existing traffic volumes and patterns. Once a calibrated model is completed, it can be used to project the traffic volumes and patterns of future land use and transportation network scenarios. The traffic demand model for this study was created using EMME software. Separate Federal Way travel demand model runs were developed for the 2025 No Action and 2025 Action Alternatives to reflect how their land use assumptions would influence travel behavior in the future. The model assumed the same future roadway improvements for both alternatives.

The MainStreet tool was developed to more accurately predict trip generation in mixed use suburban centers such as Federal Way's City Center. MainStreet evaluates whether a reduction rate in new vehicle trips from the Institute of Traffic Engineers (ITE) *Trip Generation Manual* could be applied. This method supplements the travel demand model by recognizing how built environment variables including density, diversity of land uses, destinations (accessibility), development scale, pedestrian and bicycle design, distance to transit services, and demographics affect travel. Places with higher densities, a rich variety of land uses close to one another, and high quality pedestrian, bicycle, and transit environments have lower vehicle trip generation rates. People have more choices in terms of both the travel mode as well as how far they must travel to reach various destinations.

The level of vehicle trip reduction applied to the City Center districts varied among the two alternatives, based on the land uses assumed. This approach is consistent with best practices in transportation analysis, as documented by the National Cooperative Highway Research Program (Report 684). Table 11 summarizes the trip generation for the two alternatives.

Table 11. Trip Generation by Alternative

	Land Use Type	2015 Existing	2025 No Action Alternative	2025 Action Alternative	Change from 2025 No Action to Action Alternative
AM Peak Hour	Retail	1450	1817	1789	-28
	Office	87	388	466	+78
	Hotel	100	93	334	+241
	Residential	88	742	1028	+286
	Total	1,725	3,040	3,617	+577
PM Peak Hour	Retail	4347	5542	4923	-619
	Office	81	371	401	+30
	Hotel	112	105	341	+236
	Residential	105	901	1127	+226
	Total	4,645	6,919	6,792	-127

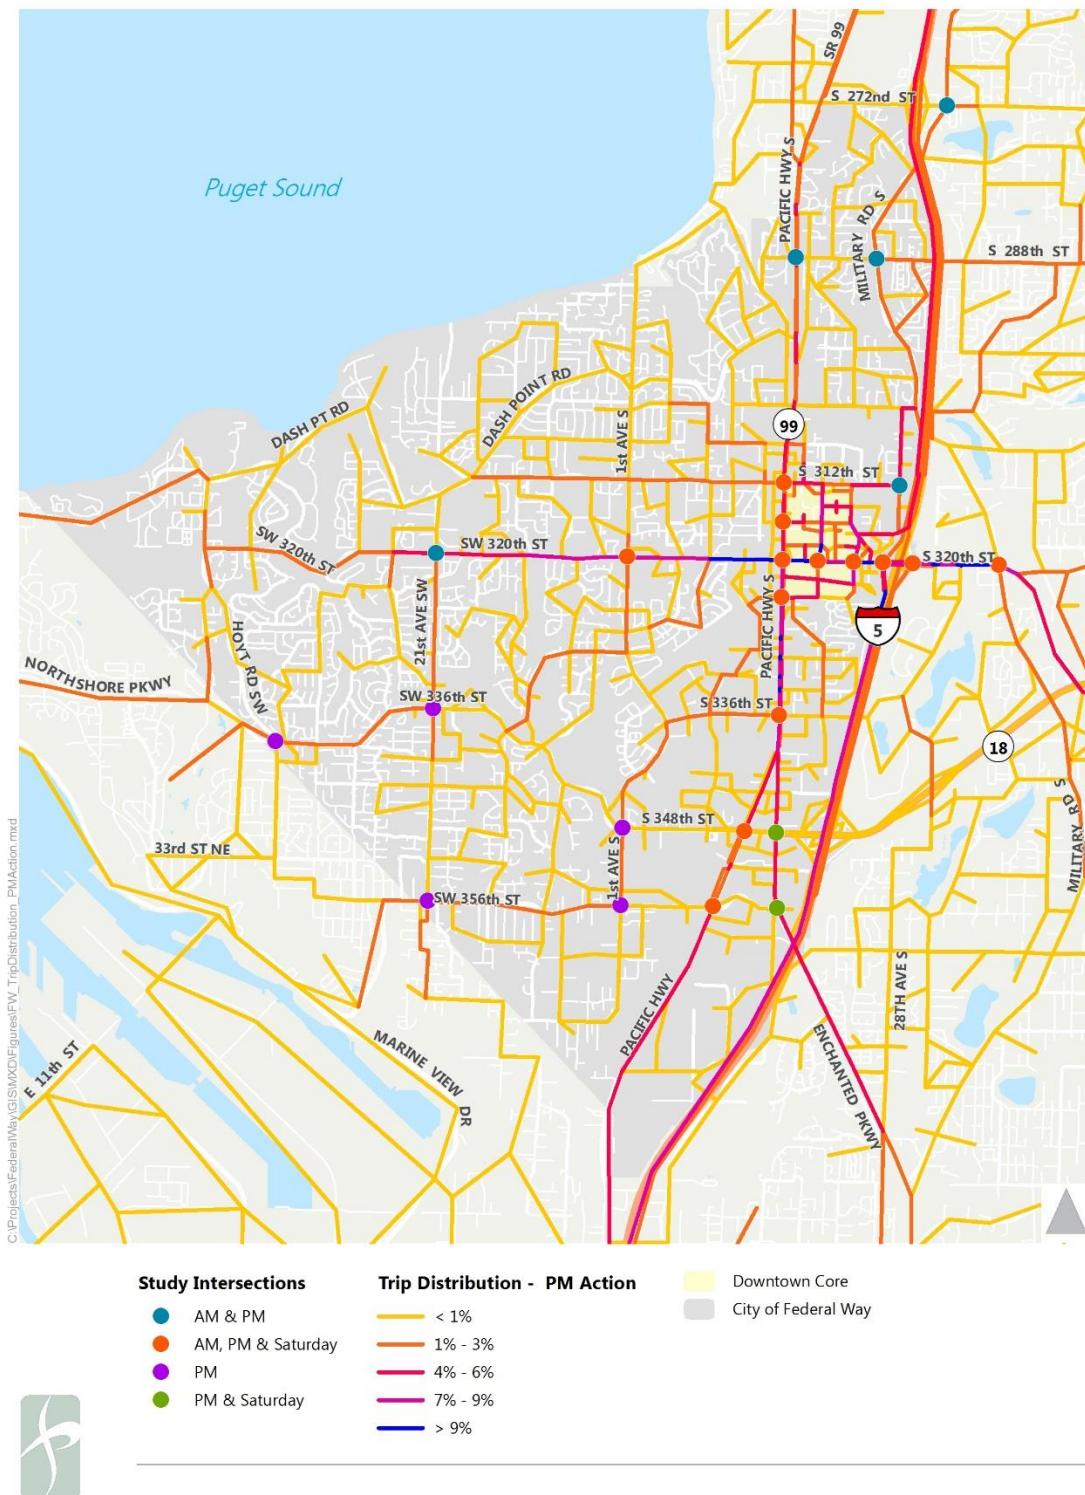

Trip Generation Differences Explained

The 2025 Action Alternative is anticipated to have more trips than the No Action Alternative in the AM peak hour (approximately 580 trips), but fewer trips (approximately 130 trips) in the PM peak hour. The increase in AM peak hour trips results from the increase in land use and lower number of trips occurring within the City Center. The decrease in PM peak hour trips is because more trips occur within the City Center area, which is referred to as the internal capture rate. It indicates that more people choose to walk, bike, or drive between land uses that are within the City Center.

Trip Distribution and Assignment

The trip distribution was based on the EMME Federal Way travel demand model; trip distribution provides an assessment of the number of people traveling to and from the site. The Saturday midday peak hour trip distribution was assumed to be the same as the PM peak hour trip distribution. The trip distribution was similar between the No Action and Action alternatives. Figure 12 summarizes the trip distribution for the Action Alternative PM peak hour.

Figure 12. Trip Distribution

Impacts

This section summarizes the transportation effects within the study area. It describes the project's impact on traffic operations, safety, transit service, and pedestrian and bicycle mobility.

Traffic Operations Impact

Common to All Alternatives

For the analysis, each of the signalized study intersections was analyzed using a 140 second cycle length in the PM peak hour and Saturday midday peak hour and a 120 second cycle length for the AM peak hour. This is consistent with the City of Federal Way's *Guidelines for the Preparation of Transportation Impact Analyses* (September 9, 2014).

No Action Alternative

Table 12 and Figures 13 through 15 provide the operations analysis for the No Action Alternative. As summarized in Table 12, none of the intersections are anticipated to be deficient based on the City of Federal Way's traffic operations standards with programmed improvements. However, it is worth noting that some of the intersections exceed the level of service (LOS) standards defined by WSDOT and PSRC:

- S 288 Street & Pacific Highway S
- S 320 Street & Pacific Highway S
- S 324 Street & Pacific Highway S
- S 336 Street & Pacific Highway S
- S 348 Street & Pacific Highway S
- S 356 Street & Pacific Highway S
- S 348 Street & SR 161

To correct the level of service (LOS) deficiencies at these locations, Federal Way and WSDOT could widen the roads and add capacity. These types of capacity additions were considered as part of the recent Comprehensive Plan Update, but were considered infeasible for the following reasons:

- Roadway expansion projects for drive alone vehicles were inconsistent with City Center Plan goals for a more walkable, accessible, and transit oriented community
- Extensive right of way impacts
- Longer traffic signal cycle lengths (because of wider roadways), which would make it more difficult for pedestrians and bicyclist to cross the street and potentially increase driver frustration with longer wait times at the signals.

The objective of the Action Alternative is to create an urban form and development pattern that encourages less auto use and provides for a more walkable and bikeable environment. Therefore, the land use pattern and supporting transportation network investments for the City Center have been developed to reduce overall auto trip generation and driving compared to the No Action Alternative. As shown in the following section, the results of the traffic impact analysis support the notion that a higher density, transit supportive land use plan for City Center has fewer traffic operations impacts than the No Action Alternative during the PM peak hour.

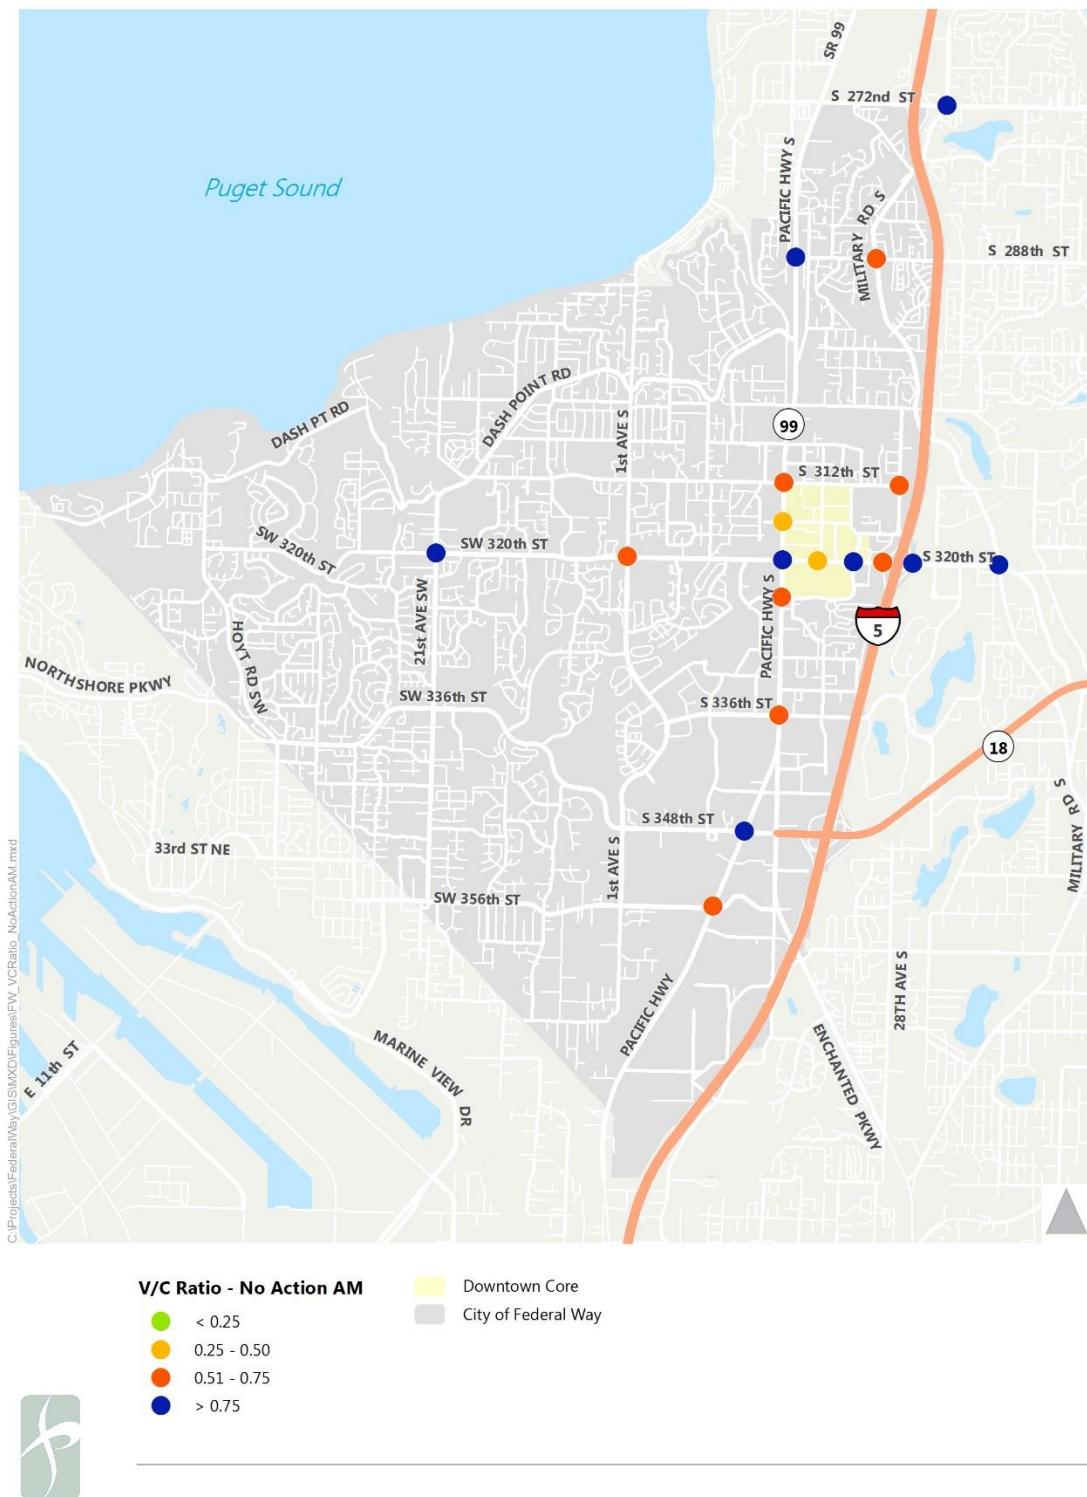

Figure 14. No Action V/C Ratio PM Peak Hour

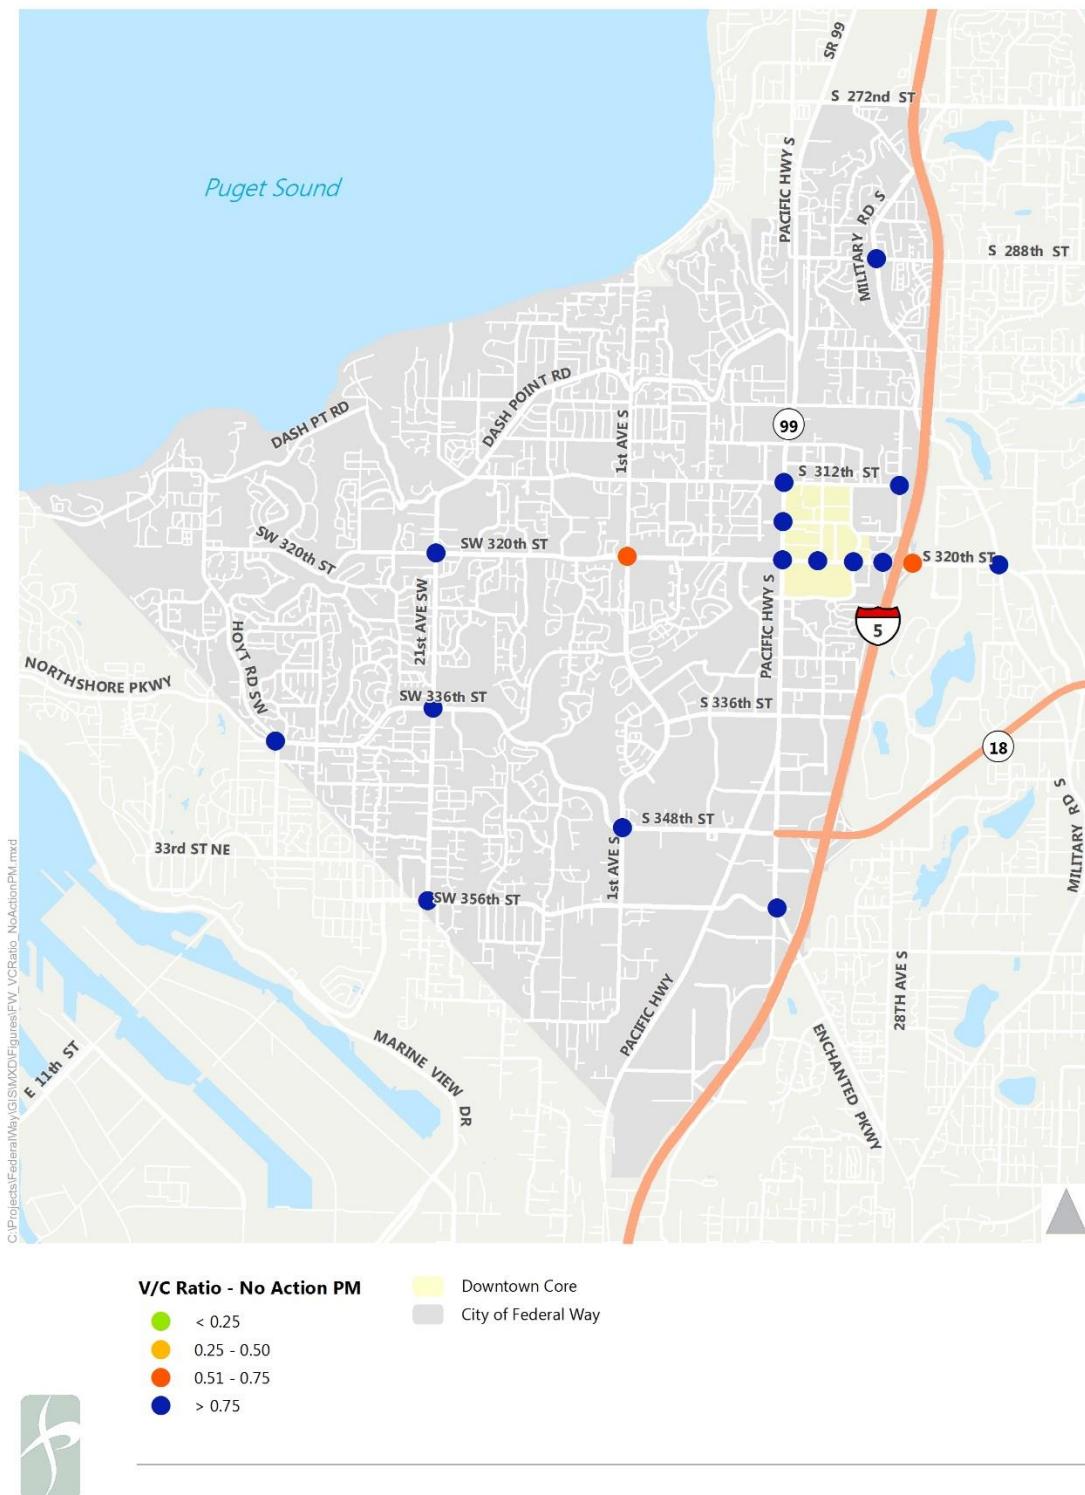

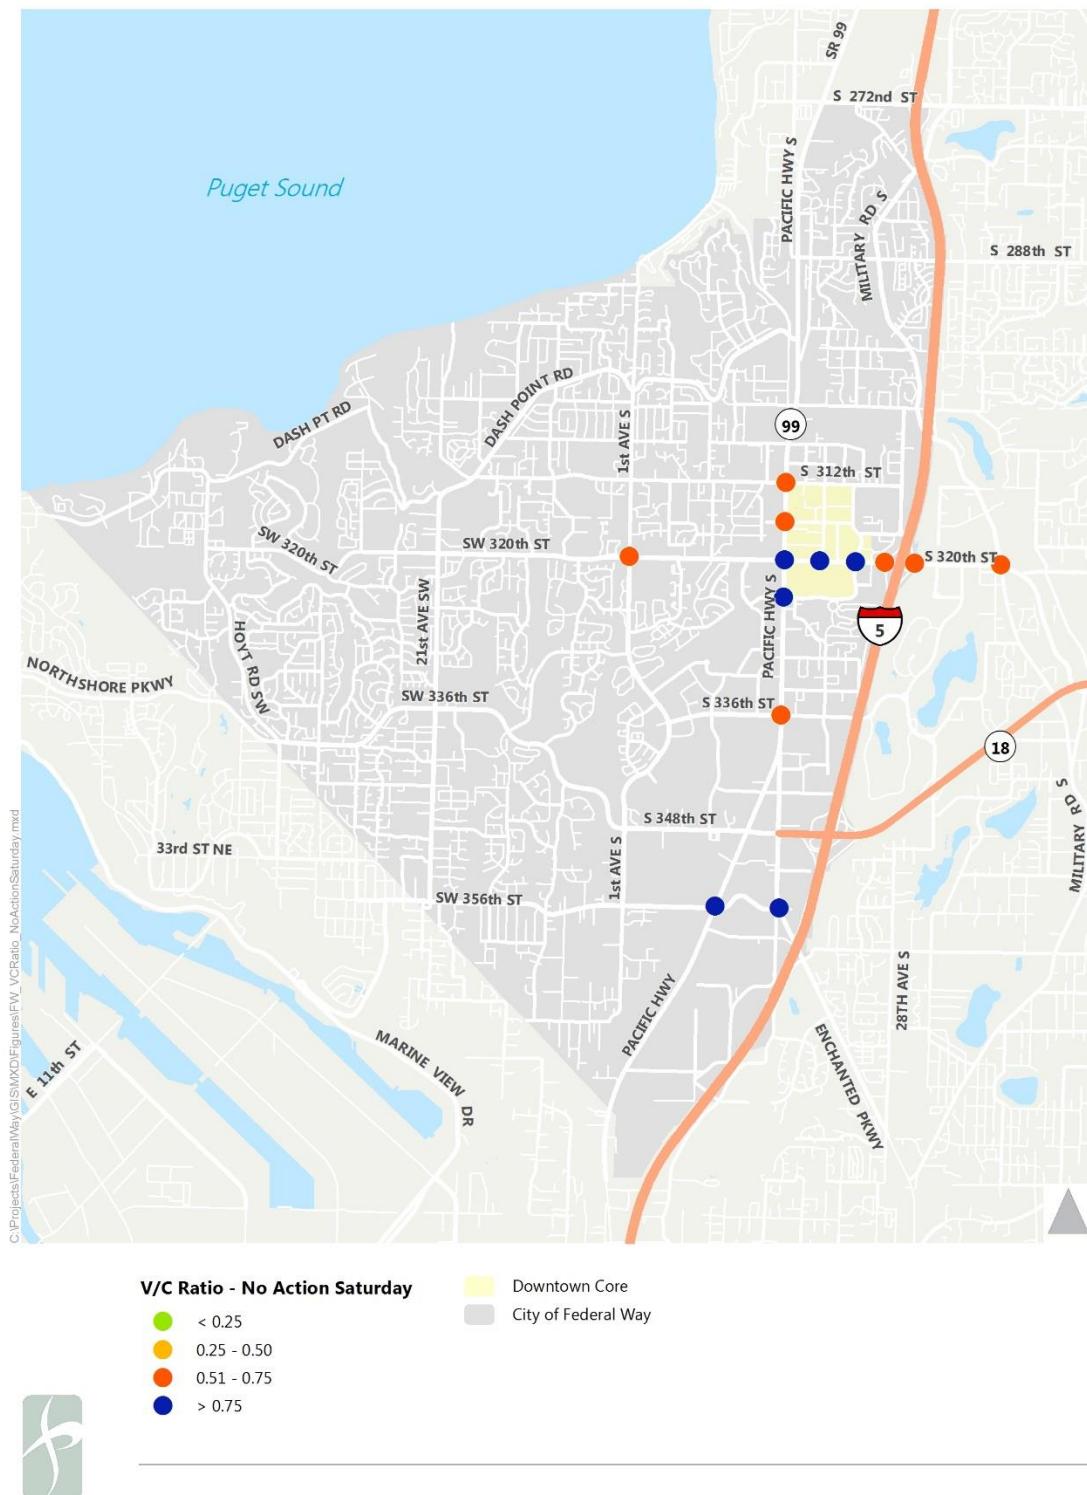

Figure 15. No Action V/C Ratio Saturday Midday Peak Hour

Action Alternative

Table 13 and Figures 16 through 18 provide the operations analysis for the Action Alternative. As shown, the Action Alternative does not degrade the LOS of any of the study intersections to be worse than the No Action Alternative. Overall, the level of intersection delay is less during the PM peak hour at all but three intersections for the Action Alternative. In these instances the delay increase is approximately three seconds and the LOS grade is unchanged. Based on these findings, the Action Alternative does not have a significant impact on traffic operations.

** Unsignalized Intersection

Figure 16. Action V/C Ratio AM Peak Hour

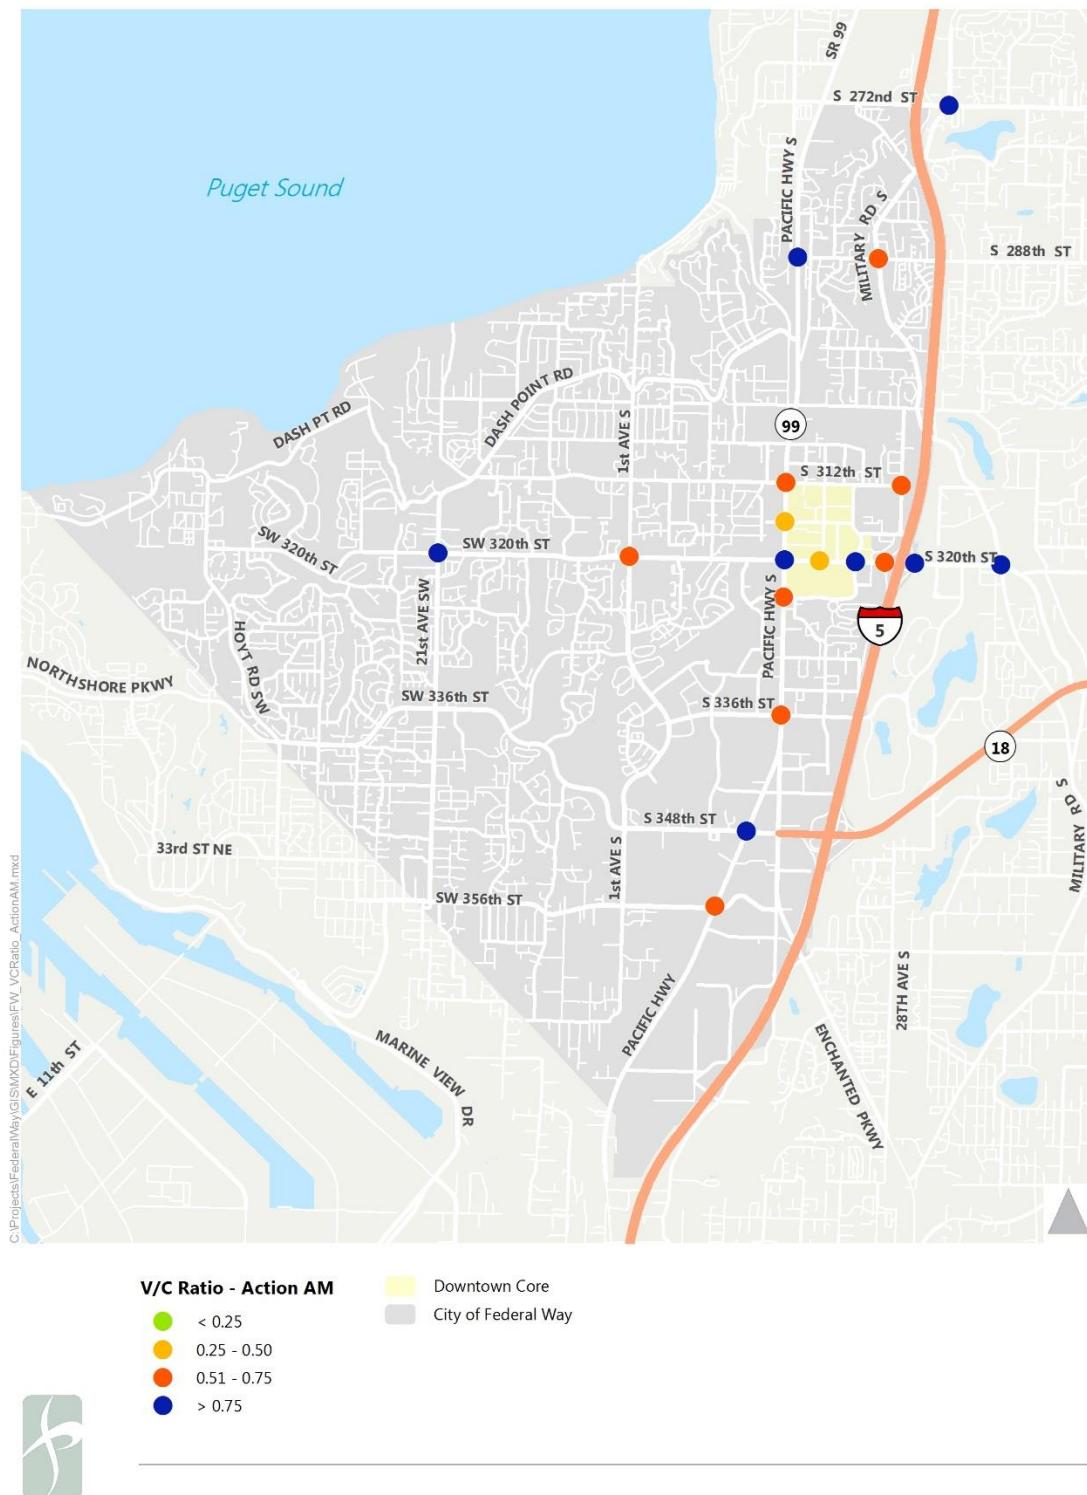

Figure 17. Action V/C Ratio PM Peak Hour

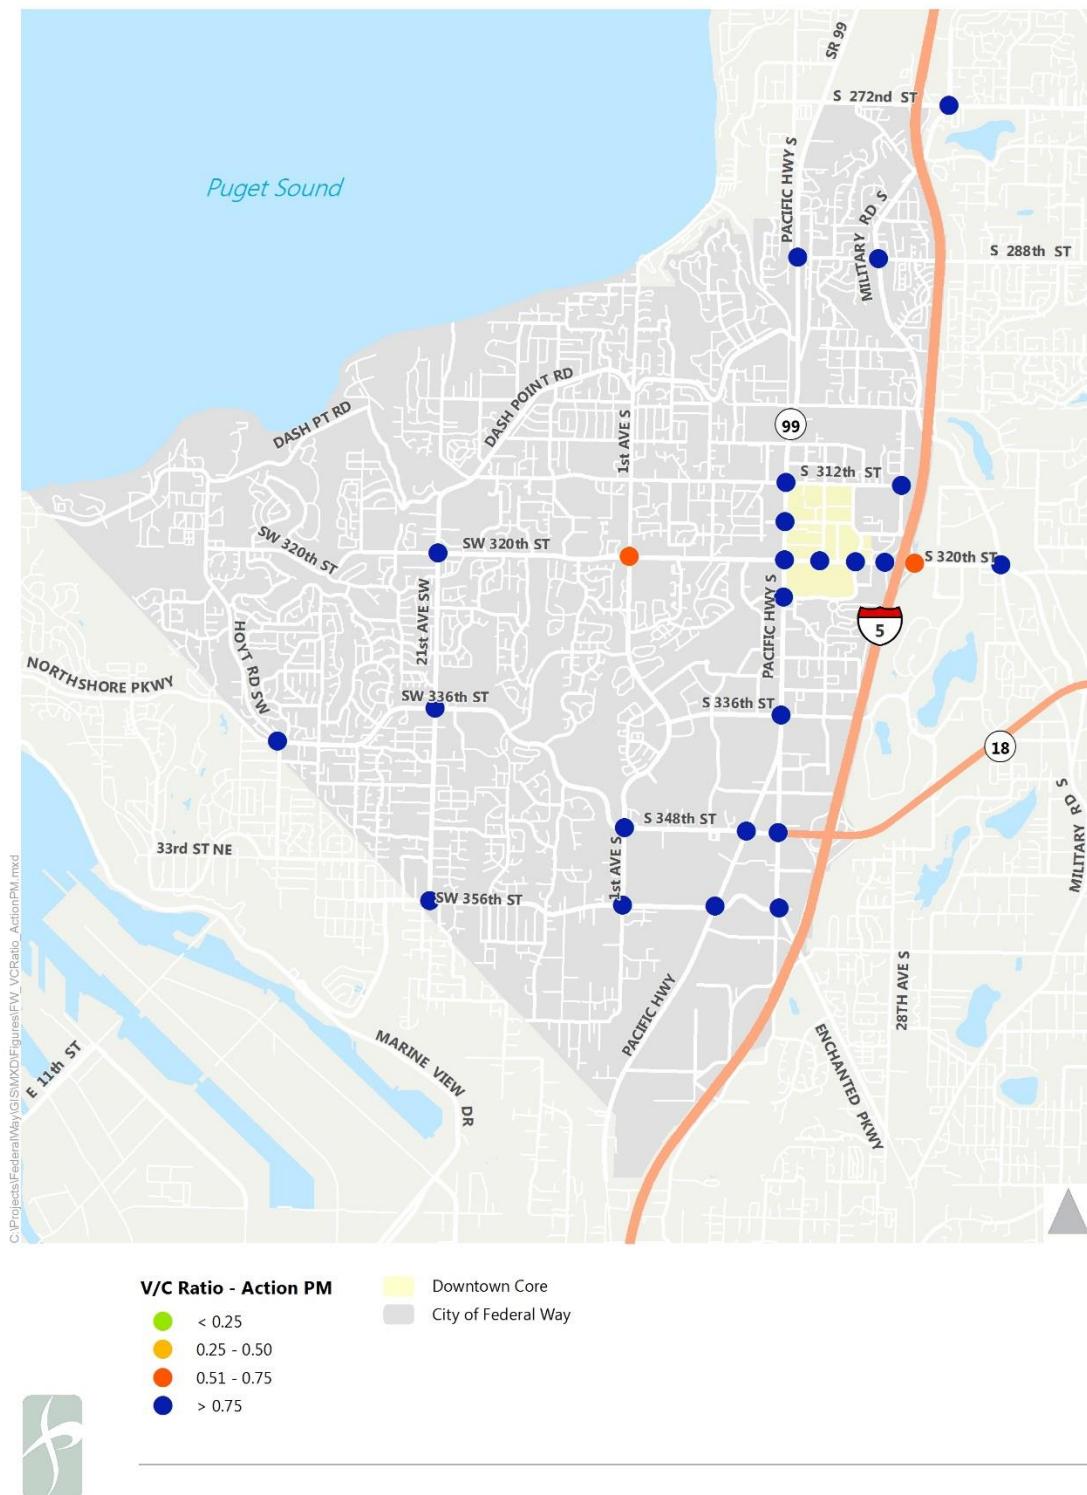

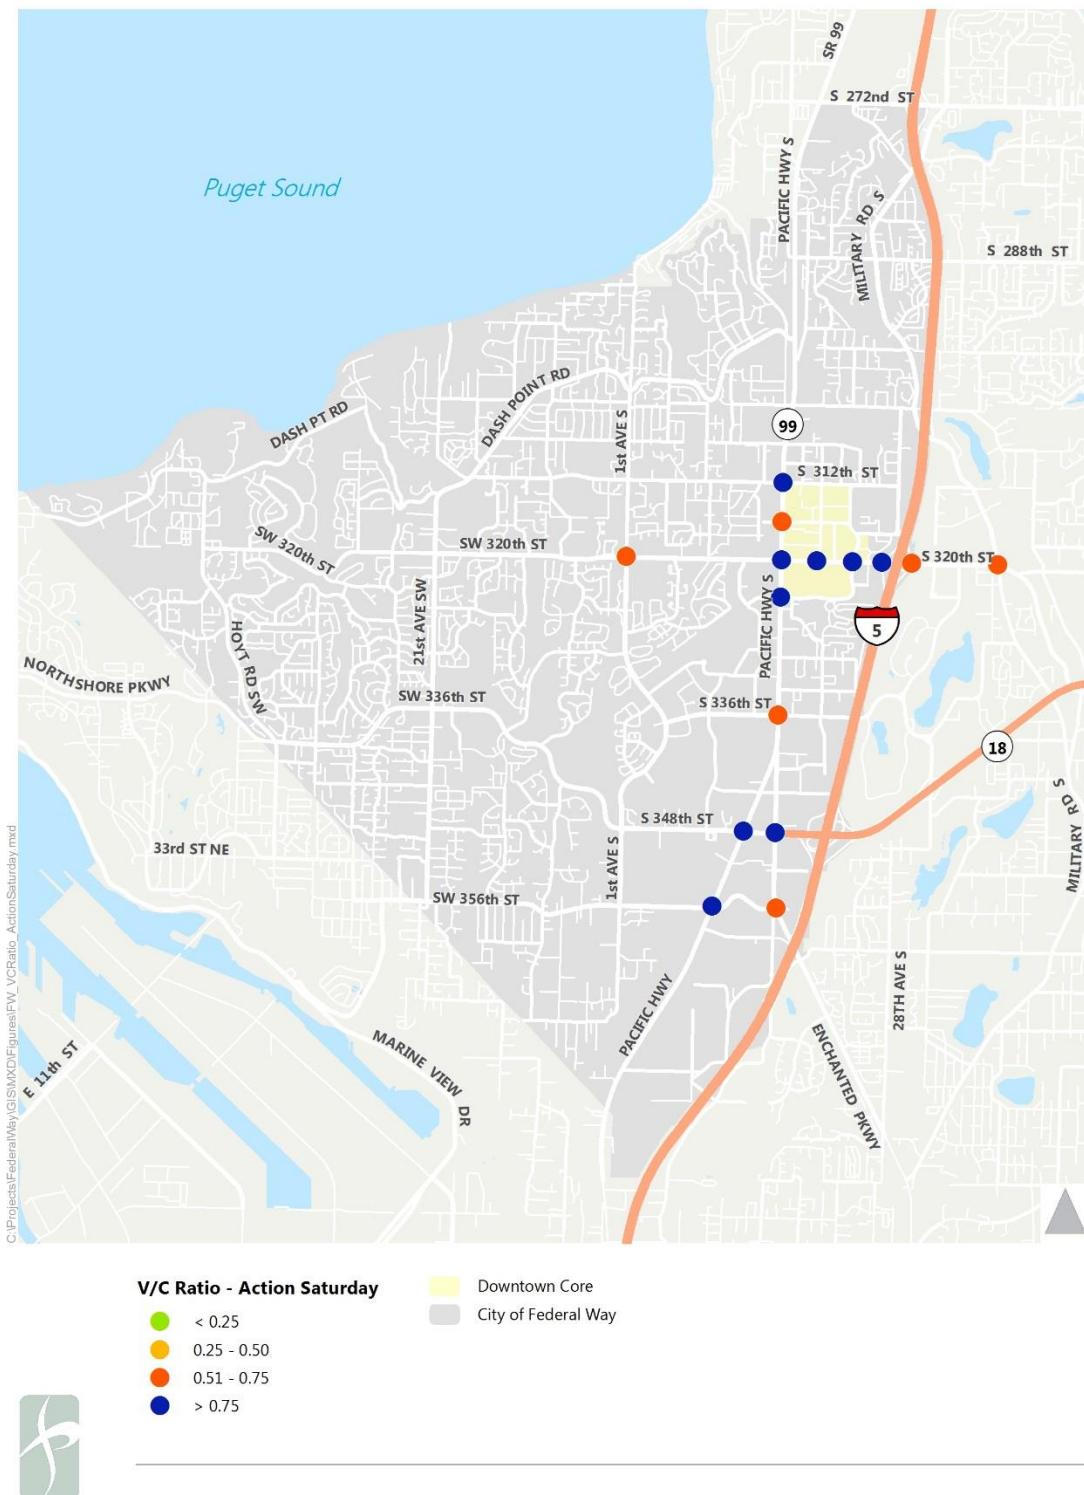

Figure 18. Action V/C Ratio Saturday Midday Peak Hour

The operations analysis shows that the Future No Action and Future Action result in very similar impact on the study intersections.

Future Parking Requirements

Common to All Alternatives

As summarized in Table 14, both the No Action and Action Alternatives would require additional parking spaces per code requirements for new development (see Table 6). These increases assume full development of the City Center. Almost 15,000 parking spaces would be required to meet the proposed Action Alternative. The number of parking spaces represents the City's Parking Code requirements. Parking would be provided on a project-by-project basis in accordance with Federal Way Revised Code requirements.

Table 14. Future Parking Requirements

	Retail (sq. ft.)	Office (sq. ft.)	Residential (units)	Hotel (rooms)	Total Parking Spaces per Code
City Code Requirement	1 per 300 sq. ft.	1 per 300 sq. ft.	1.7 per unit	1 per room	n/a
Action Land Use	2,308,189	467,045	2,654	830	
Action Parking Spaces Needed	7,694	1,557	4,512	830	14,830
No Action Land use	2,505,379	329,427	1,925	230	
No Action Parking Spaces Needed	8,351	1,098	3,273	230	12,952

Traffic Safety Impact

Common to All Alternatives

The *City of Federal Way Comprehensive Plan* identifies that congestion is a common contributing factor to vehicle collisions. As the amount of traffic increases increase within the area, the probability of traffic collisions would be expected to increase as well. Congestion is a primary factor in collision rates. However, The City and WSDOT have made investments in the study area in an on-going effort to reduce the number of preventable accidents that occur. It is anticipated that through these investments, the number of serious and preventable accidents would decrease.

Both the Action and No Action Alternatives would increase the total vehicle volume of vehicles at the high collision locations identified in Table 4. Compared to the No Action Alternative, the Action Alternative would result in fewer added trips during the PM peak hour, the period of highest traffic congestion during a typical day. The Alternatives also make up only a small portion of the entering trips for the surrounding intersections. In addition, roadway improvements designed to reduce congestion may lower congestion associated collisions.

Transit Service Impact

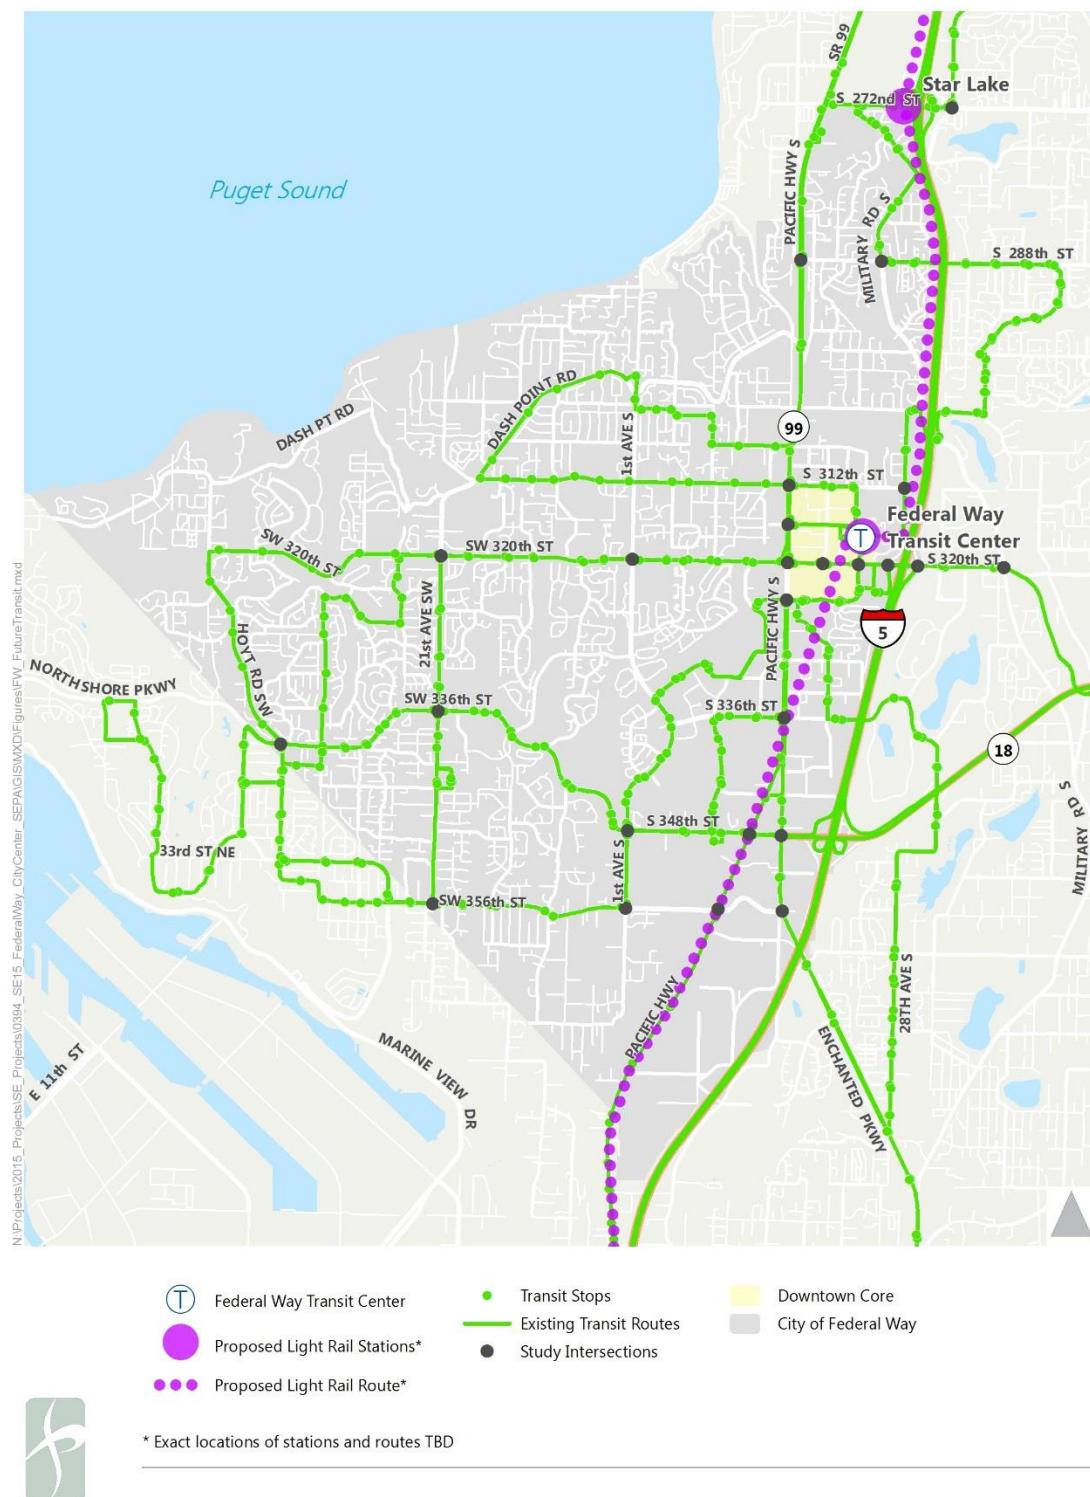

Common to All Alternatives

In the next ten years, demand for transit service in the City Center is expected to increase with the increase in jobs and households. Transit demand is to be addressed as part of the City's Comprehensive Plan. Figure 19 displays the future transit service network, including the proposed Light Rail alignment, anticipated to be opened in 2035. The City has identified SR 99 and S 320th Street along with 21st Avenue SW and 16 Avenue S as transit priority corridors.

Action Alternative

For this alternative the increase in households and office space compared to the No Action Alternative is anticipated to increase demand for transit service in the City Center.

Figure 19. Future Transit Network

Pedestrian and Bicycle Mobility Impact

Common to All Alternatives

The land use mix for the No Action and Action alternatives encourages walking and bicycling in and around the City Center. The City's *Bicycle and Pedestrian Master Plan* adopted in March 2012 highlights planned bicycle and pedestrian facilities in the City. All roads within the City Center either have an existing sidewalk or have been identified as a location for proposed sidewalks.

Some roads around the City Center, including S 324th Street, S 308th Street, and 11th Place S, have been identified as locations for future bicycle facilities.

The alternatives along with the proposed bicycle and pedestrian facilities highlighted in the *Bicycle and Pedestrian Master Plan* will increase safety and encourage walking and bicycling as a mode of transportation in and around the City Center.

Figure 20 and Figure 21 display the planned pedestrian and bicycle future networks, respectively.

Figure 20. Planned Pedestrian Network

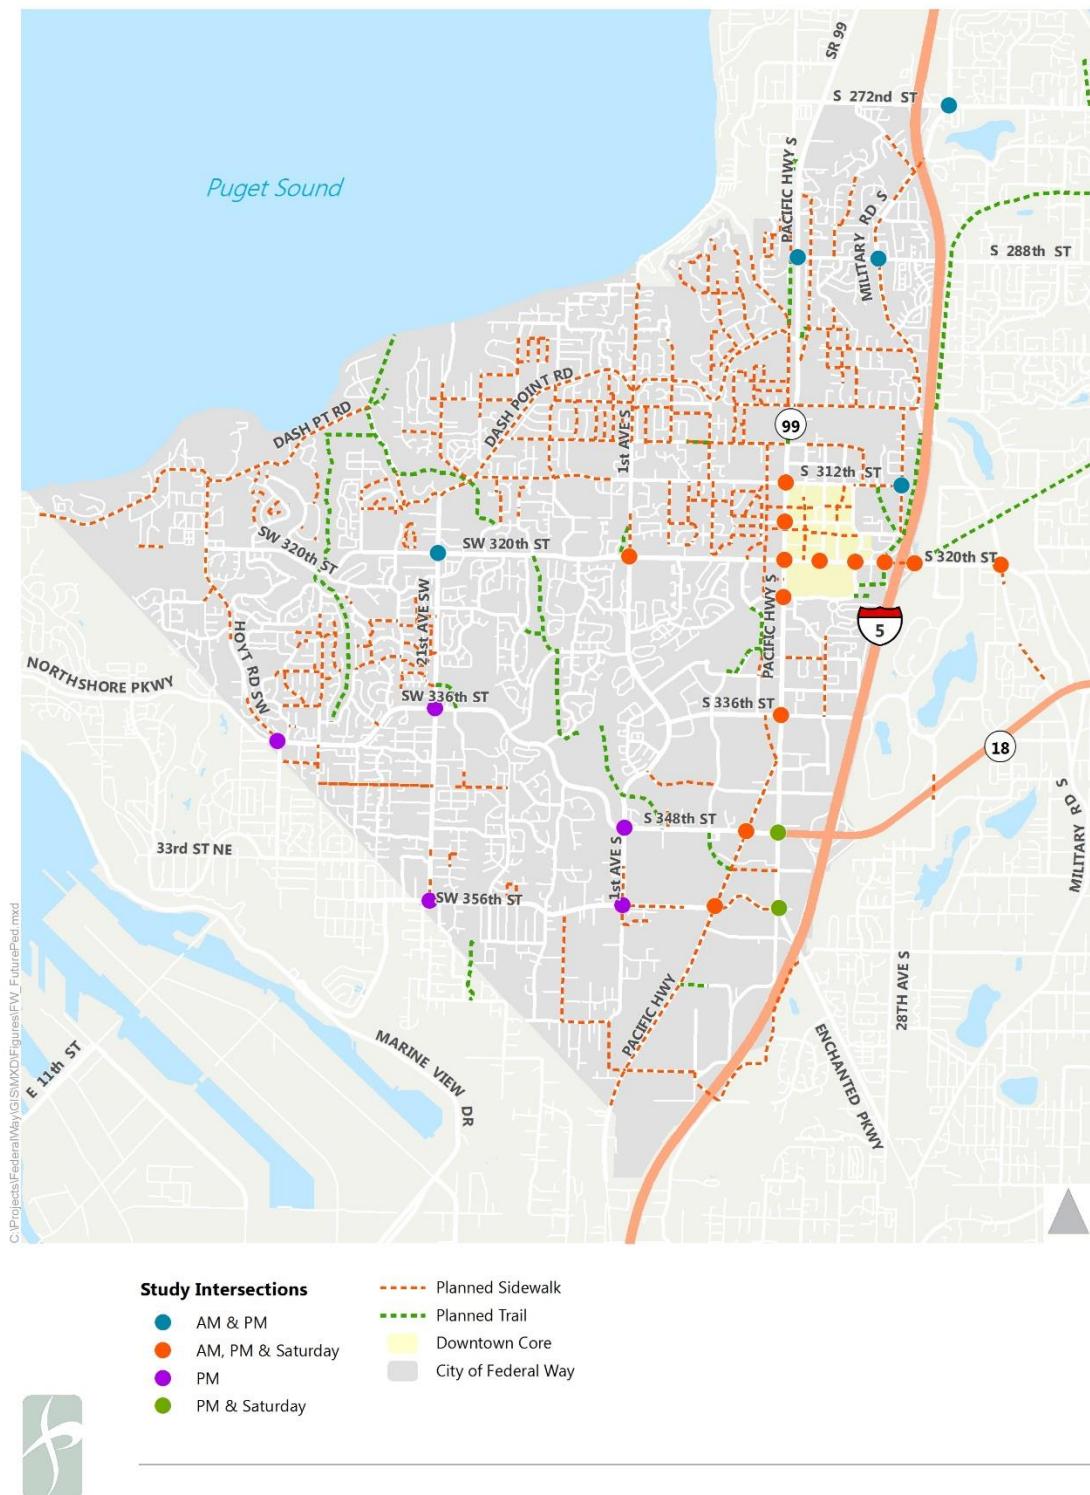

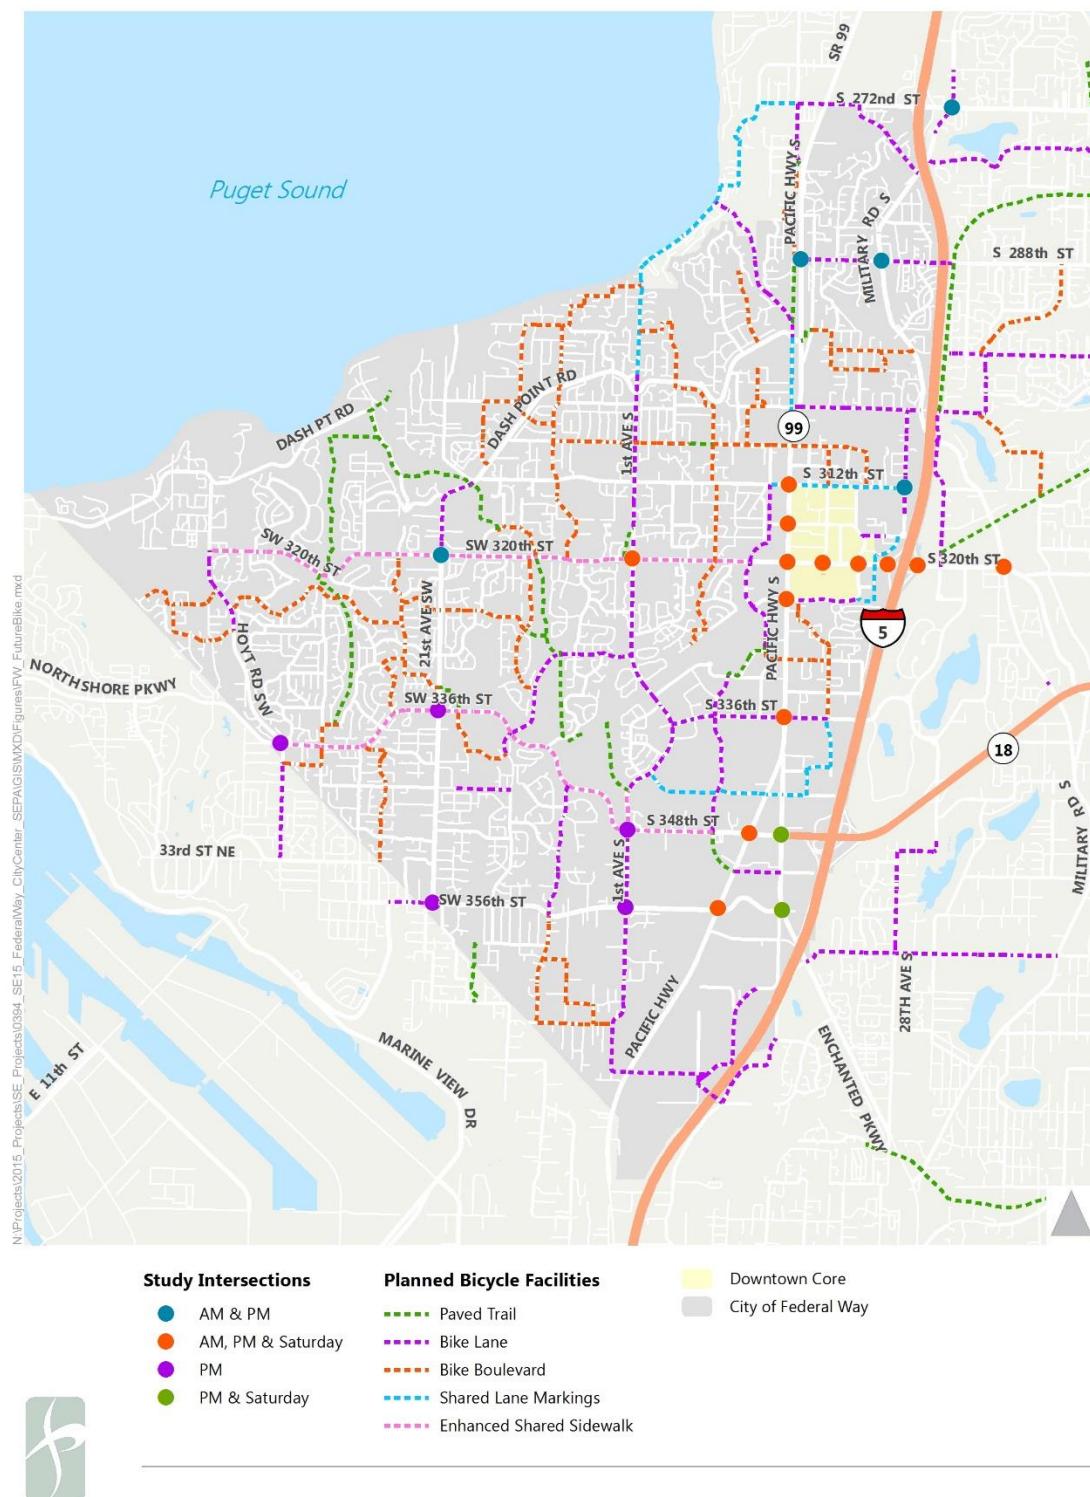

Figure 21. Planned Bicycle Network

Mitigation

This section summarizes the proposed mitigation anticipated to be required beyond the roadway improvements assumed to be constructed by 2025. These projects are listed on the City Transportation Improvement Plan and Capital Improvement Program.

Existing Roadway Network

Both the No Action and Action Alternatives would increase the density and activity within the Federal Way City Center area. The increased density could increase traffic congestion; however, these increases may be offset by reduced vehicle travel demand resulting from mixed-use development, improvements to pedestrian facilities, and improved transit services.

The Action Alternative results in a decrease in average vehicle delay at all study area intersections during the PM peak hour except for 3 intersections that experience an increase of approximately 3 seconds of average vehicle delay. For all intersections, the level of service (LOS) grade **does not degrade between** the No Action and Action Alternatives. Because the level of service grade does not change, **the transportation impacts of the Action Alternatives are less than significant and no mitigation is proposed under this *Transportation Impact Analysis*.**

While there are no impacts and thus no mitigation required for the Action Alternatives, Federal Way, Sound Transit, and WSDOT are making and planning significant investments in the area's transportation network to increase the capacity of the transportation system. These projects include the following:

- Interstate 5 – SR 161/SR18 Triangle Project: the reconstruction upgraded ramps and improved connections to and from I-5, SR 18 and SR 161. The benefits of this project are **increased travel capacity and safety improvements**.
- Pacific Highway (SR 99) Phase V High Occupancy Vehicle (HOV) Lane improvements, which widened the existing 5-lane roadway to a 7-lane section including center median, curb, sidewalk and streetlight. **The project is planned for construction in 2016.**
- Federal Way Link Extension project with plans to extend light rail **from Downtown Seattle to the Federal Way Transit Center**.
- The City's Adopted Pedestrian and Bicycle Master Plan, which proposes projects to add capacity for walking and bicycling and enhance accessibility in the area. These types of projects also reduce vehicle trip making by making it easier for people to park once and walk to multiple destinations.
- The City's ITS Plan, which when implemented, will provide better traffic signal coordination and operations, improved corridor management during incidents, and increased vehicle capacity.

Parking

Additional parking spaces will be required on site for both the No Action and Action Alternatives. These spaces may be provided on the site or as part of parking garages assumed as part of the Federal Way City Center development. The number of parking spaces required could be reduced through shared parking arrangements or transportation demand management programs. This reduction could vary from 10 percent to 20 percent based on the effectiveness and robustness of the programs implemented.

Additional Mitigation

The mitigation identified in this section is focused on additional improvements that could be required to meet the expected travel demand on area roadways associated with the proposed development in the project area.

Development will need to meet the requirements of applicable codes at the time of application. Such requirements might include the dedication of right-of-way, installing curbs gutters and sidewalks, drainage improvements, and other requirements of the City. Additional mitigation may be required for individual development applications within the project area to reduce area traffic impacts or improve on-site circulation and to meet City and State requirements for Commute Trip Reduction and Transportation Demand Management.

Actions to be considered include:

On-site improvements – Driveway and circulation actions/improvements to minimize impact on area roadways. Actions may include management of access points, traffic control measures, construction of internal roadways, pedestrian and bicycle improvements, and connections to adjacent developments.

Non-Motorized mode improvements – Mitigation may be required per site specific and land use development proposals to address pedestrian, bicycle, and transit improvements to support the plans, policies, and goals as noted within the *City of Federal Way Transportation Element*.

Grid Roadway Development – Part of the City Center Plan is to develop a number of internal roadways to create smaller blocks that will improve the grid network and improve the access for pedestrians and vehicles. Right-of-way dedication and street improvements shall be a component of the development submittal phase of a proposed project within the project area. Roadways within the project area must meet specific “City Center” design standards as specified in the Transportation Element (Chapter 3) of the *City of Federal Way Comprehensive Plan*.

Right-of-way Dedication – Right-of-way dedication and frontage improvements may be required in conjunction with proposed developments. Roadways within the project area must meet specific “City Center” design standards as specified in the Transportation Element (Chapter 3) of the *City of Federal Way Comprehensive Plan*.

Transportation Demand Management (TDM) – TDM actions can be used to reduce the impact of the project and as a mitigation action. These actions may include provision of transit passes to tenants and employees, ridesharing programs, priority carpool parking, and guaranteed ride home programs. TDM actions are designed to primarily address commute trips and may not be applicable as mitigation for all developments. The *City of Federal Way Comprehensive Plan* summarizes TDM alternatives by their functional grouping and potential effectiveness, implementation difficulties, and expected cost effectiveness. These strategies include: Telecommuting, Parking Management and Pricing, Flexible Work Schedule, Rideshare programs, Traveler Information, Public Relations, and Marketing.

The following are a list of recommended mitigation measures that can be considered in conjunction with individual development projects within the project area:

1. Encourage voluntary expansion of the CTR Program to employers of less than 100 employees. The encouragement by employers may be as diverse as subsidized bus passes,

- car pool space priority, bike racks, shower facilities, van pools, car pool information access, telecommuting, variable work hours, etc.
2. Encourage the formation and expansion of area-wide ride-sharing programs. Such programs operate with little direct cost to the City and are highly cost effective.
 3. Support the enhancement of Park and Ride facilities and transit centers to supplement the regional system, either directly through physical development or enhancements or indirectly through development conditions where employer vans are required to shuttle employees to Park and Ride facilities or transit centers.
 4. Facilitate enhancements to the HOV system. This may include the dedication of property for HOV lanes, construction of arterial HOV lanes within existing City ROW, and priority treatments for buses at traffic signals. At the very least, where feasible, opportunities to enhance access to the State system of HOV lanes should be considered.
 5. Achieve increased densities and mix of uses to support public transportation, decrease trip generation and parking impacts.
 6. Encourage facilities (shelters, loading spaces, etc.) to accommodate City Center shuttle service in association with development projects, together with enhanced pedestrian and bicycle access and security.
 7. Improve pedestrian and bicycle access to bus routes and transit centers. This can be a requirement of subdivision, development, and redevelopment. The City may need to acquire easements and construct trail connections. Development incentives could be granted for providing such amenities that are pedestrian, bike, and transit friendly. While bicycle, pedestrian, and bus transit services and facilities may be desirable for other reasons; they should not be looked on as highly cost-effective strategies to the exclusion of those actions listed above.

Neighborhood Traffic Control – Development within the project area may be required to include actions to reduce the impact of cut through traffic on residential areas. Examples of neighborhood traffic control actions include: turn restrictions, speed controls, traffic enforcement, and parking restrictions.

Parking – Mitigation actions that reduce the parking requirements within the project area should be encouraged. Examples include shared parking, employee parking programs, parking time restrictions, paid parking programs. Shared parking strategies focus on looking at opportunities where adjacent uses have parking demand profiles that can support the sharing of a smaller amount of parking spaces. For example, an office building with an 8 AM to 5 PM demand could share its parking with evening dominated uses such as restaurants, or a cinema. A parking demand study, which shows the hourly parking demand profiles for adjacent uses and the potential for joint parking opportunities within a mixed-use development, can be used to reduce the number of parking spaces.

In addition, contained in the above TDM mitigation are strategies that overlap with parking mitigation plans for development. A development may propose a plan and management system to the City for approval upon submittal of the development permit. Those items may contain the following in support of the City of Federal Way and state Commute Trip Reduction (CTR) requirements:

ALTERNATIVE MODE SUPPORT MEASURES

Public education and promotion may increase the effectiveness of these other strategies up to 3%.

Area-wide Ride matching Services – May result in a 0.1-3.6% reduction in vehicle miles traveled (VMT) and an up to 2.5% VMT reduction in transit services. Reductions in parking required may be calculated on the basis of these lower trip-generation rates.

Vanpool Service – May result in an up to 8.3% in commute VMT, as well as a reduction in transit and vanpool fares up to 2.5%. Reductions in parking required may be calculated on the basis of these lower trip-generation rates.

Non-Motorized Modes plan and implementation – May result in an up to 0-2% regional VMT reduction. Reductions in parking required may be calculated on the basis of these lower trip-generation rates.

HOV Facilities – May result in an up to 1.5% VMT reduction and 0.2% vehicle trip reduction. Reductions in parking required may be calculated on the basis of these lower trip-generation rates.

On site development of Park and Ride program – May result in up to 0-0.5% VMT reduction. Reductions in parking required may be calculated on the basis of these lower trip-generation rates.

EMPLOYER-BASED TDM MEASURES

Parking mitigation – Monetary incentives may result in an up to 8-18% trip reduction at site. Reductions in parking required may be calculated on the basis of these lower trip-generation rates.

Alternative Work Schedules – May result in as much as a 1% regional VMT reduction. Reductions in parking required may be calculated on the basis of these lower trip generation rates.

Commute Support Programs – May result in up to 0.1-2.0% regional VMT reduction. Reductions in parking required may be calculated on the basis of these lower trip generation rates.

Parking Management – May result in up to a 20 to 30% reduction in SOV trips to/from the site. Reductions in parking required may be calculated on the basis of these lower trip-generation rates.

Telecommuting – Up to 10% commute VMT reduction. Reductions in parking required may be calculated on the basis of these lower trip-generation rates.

OTHER STRATEGIES

Parking Tax – May result in up to a 1 to 5% reduction in regional VMT and trip generation, but requires City Council and/or legislative action. Reductions in parking required may be calculated on the basis of these lower trip-generation rates.

Development Parking Impact Mitigation – Requires Council approval to allow for payment of parking-mitigation funds towards long term investments in structured parking solutions in lieu of full parking requirement. Reductions in parking required may be calculated on the basis of these lower trip-generation rates.

Mixed Land Use/Jobs Housing Balance – May result in VMT reductions up to 10%. Parking stall credit is given based on overlapping shared usage of mixed facility, per City Code provisions.

Transit-Oriented and Pedestrian-Friendly Design – Site and building design that encourages transit usage and/or walking may reduce overall parking requirement. Requires design review and staff approval.

Employment Center Density - Achievement of sufficient density within the City Center to constitute a regional employment center may reduce SOV work trips to individual development projects by up to 50%. Parking stall reductions may also apply to developments.

Other Parking Management Plans – May mitigate 1 to 5% region-wide VMT, provided enforcement issues are addressed in the mitigation plan.
